Computational Techniques For Modeling Learning In Economics:

Computational Techniques for Modelling Learning in Economics Thomas Brenner, 2012-12-06 *Computational Techniques for Modelling Learning in Economics* offers a critical overview of the computational techniques that are frequently used for modelling learning in economics. It is a collection of papers each of which focuses on a different way of modelling learning including the techniques of evolutionary algorithms, genetic programming, neural networks, classifier systems, local interaction models, least squares learning, Bayesian learning, boundedly rational models, and cognitive learning models. Each paper describes the technique it uses, gives an example of its applications, and discusses the advantages and disadvantages of the technique. Hence the book offers some guidance in the field of modelling learning in computation economics. In addition, the material contains state-of-the-art applications of the learning models in economic contexts such as the learning of preference, the study of bidding behaviour, the development of expectations, the analysis of economic growth, the learning in the repeated prisoner's dilemma, and the changes of cognitive models during economic transition. The work even includes innovative ways of modelling learning that are not common in the literature, for example, the study of the decomposition of task or the modelling of cognitive learning. *Computational Techniques for Econometrics and Economic Analysis* D.A.

Belsley, 2013-04-17 It is unlikely that any frontier of economics/econometrics is being pushed faster further than that of computational techniques. The computer has become a tool for performing as well as an environment in which to perform economics and econometrics, taking over where theory bogs down, allowing at least approximate answers to questions that defy closed mathematical or analytical solutions. Tasks may now be attempted that were hitherto beyond human potential, and all the forces available can now be marshalled efficiently, leading to the achievement of desired goals. *Computational Techniques for Econometrics and Economic Analysis* is a collection of recent studies which exemplify all these elements, demonstrating the power that the computer brings to the economic analyst. The book is divided into four parts: 1. the computer and econometric methods; 2. the computer and economic analysis; 3. computational techniques for econometrics; and 4. the computer and econometric studies. *Evolutionary Computation in Economics and Finance* Shu-Heng

Chen, 2013-11-11 After a decade's development, evolutionary computation (EC) proves to be a powerful tool kit for economic analysis. While the demand for this equipment is increasing, there is no volume exclusively written for economists. This volume, for the first time, helps economists to get a quick grasp on how EC may support their research. A comprehensive coverage of the subject is given that includes the following three areas: game theory, agent-based economic modelling, and financial engineering. Twenty leading scholars from each of these areas contribute a chapter to the volume. The reader will find himself treading the path of the history of this research area from the fledgling stage to the burgeoning era. The results on games, labour markets, pollution control, institution, and productivity, financial markets, trading systems, design, and derivative pricing are new and interesting for different target groups. The book also includes information on web sites, conferences, and
