from various architectures and implementations When necessary the author creates simplified examples that clearly explain architectural and implementation features used across many computing platforms Following an introduction that discusses the difference between architecture and implementation and how they relate the next four chapters cover the architecture of traditional single processor systems that are still after 60 years the most widely used computing machines The final two chapters explore approaches to adopt when single processor systems do not reach desired levels of performance or are not suited for intended applications Topics include parallel systems major classifications of architectures and characteristics of unconventional systems of the past present and future This textbook provides students with a thorough grounding in what constitutes high performance and how to measure it as well as a full familiarity in the fundamentals needed to make systems perform better This knowledge enables them to understand and evaluate the many new systems they will encounter throughout their professional careers
