**Computer Algebra and Materials Physics** Akihito Kikuchi, 2018-06-26 This book is intended as an introductory lecture in material physics in which the modern computational group theory and the electronic structure calculation are in collaboration The first part explains how to use computer algebra for applications in solid state simulation based on the GAP computer algebra package Computer algebra enables us to easily obtain various group theoretical properties such as the representations character tables and subgroups Furthermore it offers a new perspective on material

design which could be executed in a mathematically rigorous and systematic way The second part then analyzes the relation between the structural symmetry and the electronic structure in C60 as an example of a system without periodicity The principal object of the study was to illustrate the hierarchical change in the quantum physical properties of the molecule which correlates to the reduction in the symmetry as it descends down in the ladder of subgroups The book also presents the computation of the vibrational modes of the C60 by means of the computer algebra In order to serve the common interests of researchers the details of the computations the required initial data and the small programs developed for the purpose are explained in as much detail as possible
