**Computer Simulation in Materials Science** H.O. Kirchner, Ladislav P. Kubin, Vassilis Pontikis, 1996-01-31 For decades to come the limits to computing power will not allow atomistic simulations of macroscopic specimens Simulations can only be performed on various scales nano meso micro and macro using the input provided by simulations or data on the next smaller scale The resulting hierarchy has been the focus of many seminars and lectures Necessarily special emphasis has been placed on mesoscopic simulations bridging the gaps

between nano atomic and micro space and time scales The contributors to Computer Simulation in Materials Science consider both fundamental problems and applications Papers on the evolution of morphological patterns in phase transformations and plastic deformation irradiation effects mass transport and mechanical properties of materials in general highlight what has already been achieved It is concluded that computer simulations must be based on realistic and efficient models the fundamental equations controlling the dynamical evolution of microstructures stochastic field kinetic models being a case in point The mesoscopic approach has proved particularly effective in plastic deformation and work hardening On the mesoscopic scale the contributions made to the deformation of polycrystals and localized plastic flow show the importance of computing power in ongoing and future research
