Computer Communications Networks:

Computer Communication Networks R.L. Grimsdale, F.F. Kuo, 1975-02-28 In 1968 the Advanced Research Projects Agency ARPA of the U S Department of Defense began implementation of a computer communication network which permits the interconnection of heterogeneous computers at geographically distributed centres throughout the United States This network has come to be known as the ARPANET and has grown from the initial four node configuration in 1969 to almost forty nodes including satellite nodes in Hawaii Norway and London in late 1973 The major goal of ARPANET is to achieve resource sharing among the network users The resources to be shared include not only programs but also unique facilities such as the powerful ILLIAC IV computer and large global weather data bases that are economically feasible when widely shared The ARPANET employs a distributed store and forward packet switching approach that is much better suited for computer communications networks than the more conventional circuit switching approach Reasons favouring packet switching include lower cost higher capacity greater reliability and minimal delay All of these factors are discussed in these Proceedings

Computer Communications and Networks John R. Freer, 2012-12-06 Computer communications is one of the most rapidly developing technologies and it is a subject with which everyone in the computer systems profession should be familiar Computer communications and networks is an introduction to communications technology and system design for practising and aspiring computer professionals The subject is described from the computer system designer's point of view rather than from the communications engineer's viewpoint The presentation is suitable for introductory reading as well as for reference The emphasis is on practical rather than theoretical aspects and on technology which will become more important in the future The majority of the subject matter applies to civil and military communications but some aspects which are unique to military applications have been included where considered significant Computer communications is a rapidly changing and highly complex subject Sufficient practical knowledge of the subject is not usually gained at university or college but is generally developed over a period of several years by trial and error attending courses reading reference books and journals this book attempts to simplify and speed up the process by bringing together a body of information which is otherwise distributed throughout many books and journals The information is presented in a framework which makes a wider understanding of the subject possible Basic knowledge of communications is assumed a general familiarity with computer systems is anticipated in later chapters and where relevant theory is explained

Communication Networks and Computer Systems Javier A. Barria, 2006 Communication networks and computer systems research is entering a new phase in which many of the established models and techniques of the last twenty years are being challenged The research community is continuing to free itself from past intellectual constraints so that it may fully exploit the convergence of computing and communications Evaluating the performance of emerging communications and computer systems constitutes a huge challenge Thus current research provides a set of heterogeneous tools and techniques embracing the uncertainties of time

and space varying environments when the requests for diverse services are made in real time and with very different quality of service expectations These novel techniques will lead to fast and economic service deployment and effective dynamic resource management and hence to new business strategies and infrastructures that will facilitate the emergence of future services and applications This volume contains contributions and presentations made by leading international researchers at a workshop which was held in April 2004 to honour Professor Erol Gelenbe on the occasion of his inaugural lecture as the Dennis Gabor Chair at Imperial College London

Computer and Communication Networks Nader F. Mir,2006-11-02 As the number and variety of communication services grow so do the challenges of designing cost effective networks that meet the requirements of emerging technologies in wireless sensor and mesh networks Computer and Communication Networks is the first book to offer balanced coverage of all these topics using extensive case studies and examples This essential reference begins by providing a solid foundation in TCP IP schemes wireless networking Internet applications and network security The author then delves into the field s analytical aspects and advanced networking protocols Students and researchers will find up to date comprehensive coverage of fundamental and advanced networking topics including Packet switched networks and Internet Network protocols Links LAN Protocols Wireless Networks Transport Protocols Applications and Management Network Security Delay Analysis QoS High speed protocols Voice over IP Optical Networks Multicasting Protocols Compression of Voice and Video Sensor Mesh Networks Network architecture books are often criticized for not offering enough practical scenario based information Computer and Communication Networks provides an effective blend of theory and implementation not found in other books Key features include Figures and images that simplify complex topics Equations and algorithms Case studies that further explain concepts and theory Exercises and examples honed through the author s twelve years of teaching about networking Overall readers will find a thorough design and performance evaluation that provides a foundation for developing the ability to analyze and simulate complex communication networks

Modeling and Analysis of Computer Communications Networks

Jeremiah F. Hayes, 2013-03-08 In large measure the traditional concern of communications engineers has been the conveyance of voice signals The most prominent example is the telephone network in which the techniques used for transmission multiplexing and switching have been designed for voice signals However one of the many effects of computers has been the growing volume of the sort of traffic that flows in networks composed of user terminals processors and peripherals The characteristics of this data traffic and the associated performance requirements are quite different from those of voice traffic These differences coupled with burgeoning digital technology have engendered a whole new set of approaches to multiplexing and switching this traffic The new techniques are the province of what has been loosely called computer communications networks The subject of this book is the mathematical modeling and analysis of computer communications networks that is to say the multiplexing and switching techniques that have been developed for data traffic The basis for many of the models that we shall consider is queueing theory although a number of other disciplines are drawn on as well The level at which this material is covered is that of a first year graduate course It is assumed that at the outset the student has had a good undergraduate course in probability and random processes of the sort that are more and more common among electrical engineering and computer science departments

Computer-Communication Networks

James S. Meditch, Wesley W. Chu, 2014-05-23 Computer Communication Networks presents a collection of articles the focus of which is on the field of modeling analysis design and performance optimization It discusses the problem of modeling the performance of local area networks under file transfer It addresses the design of multi hop mobile user radio networks Some of the topics covered in the book are the distributed packet switching queueing network design some investigations on communication switching techniques in computer networks and the minimum hop flow assignment and routing subject to an average message delay constraints The analysis of the multi access communication channel is covered The local area network file transfers are discussed The text describes the CSMA/CD protocol The congestion control scheme for window flow controlled computer network is presented A chapter of the volume is devoted to the description of a fairness control algorithm Another section of the book focuses on the analysis of hierarchical model The book will provide useful information to computer programmers network analysts students and researchers
