Database Transaction Processing:

Transaction Processing Jim Gray, Andreas Reuter, 1992-09-30 The key to client server computing Transaction processing techniques are deeply ingrained in the fields of databases and operating systems and are used to monitor control and update information in modern computer systems This book will show you how large distributed heterogeneous computer systems can be made to work reliably Using transactions as a unifying conceptual framework the authors show how to build high performance distributed systems and high availability applications with finite budgets and risk The authors provide detailed explanations of why various problems occur as well as practical usable techniques for their solution Throughout the book examples and techniques are drawn from the most successful commercial and research systems Extensive use of compilable C code fragments demonstrates the many transaction processing algorithms presented in the book The book will be valuable to anyone interested in implementing distributed systems or client server architectures

Principles of Transaction Processing for the Systems Professional Philip A. Bernstein, Eric Newcomer, 1997 The best introduction to transaction processing systems I have ever read K Torp ACM Computing Reviews November 1997 Principles of Transaction Processing is a clear concise guide for anyone involved in developing applications evaluating products designing systems or engineering products This book provides an understanding of the internals of transaction processing systems describing how they work and how best to use them It includes the architecture of transaction processing monitors transactional communications paradigms and mechanisms for recovering from transaction and system failures Use of transaction processing systems in business industry and government is increasing rapidly the emergence of electronic commerce on the Internet is creating new demands As a result many developers are encountering transaction processing applications for the first time and need a practical explanation of techniques Software engineers who build and market operating systems communications systems programming tools and other products used in transaction processing applications will also benefit from this thorough presentation of principles Rich with examples it describes commercial transaction processing systems transactional aspects of database servers messaging systems Internet servers and object oriented systems as well as each of their subsystems Features Easy to read descriptions of fundamentals Real world examples illustrating key points Focuses on practical issues faced by developers Explains most major products and standards including IBM s CICS IMS and MQSeries X Open s XA STDL and TX BEA Systems TUXEDO Digital s ACMS Transarc s Encina AT Tandem s Pathway TS OMG s OTS and Microsoft s Microsoft Transaction Server

Transaction Processing Seppo Sippu, Eljas Soisalon-Soininen, 2015-01-27 Transactions are a concept related to the logical database as seen from the perspective of database application programmers a transaction is a sequence of database actions that is to be executed as an atomic unit of work The processing of transactions on databases is a well established area with many of its foundations having already been laid in the late 1970s and early 1980s The unique feature of this textbook is that it bridges the gap between the theory of transactions on the

logical database and the implementation of the related actions on the underlying physical database The authors relate the logical database which is composed of a dynamically changing set of data items with unique keys and the underlying physical database with a set of fixed size data and index pages on disk Their treatment of transaction processing builds on the do redo undo recovery paradigm and all methods and algorithms presented are carefully designed to be compatible with this paradigm as well as with write ahead logging steal and no force buffering and fine grained concurrency control Chapters 1 to 6 address the basics needed to fully appreciate transaction processing on a centralized database system within the context of our transaction model covering topics like ACID properties database integrity buffering rollbacks isolation and the interplay of logical locks and physical latches Chapters 7 and 8 present advanced features including deadlock free algorithms for reading inserting and deleting tuples while the remaining chapters cover additional advanced topics extending on the preceding foundational chapters including multi granular locking bulk actions versioning distributed updates and write intensive transactions This book is primarily intended as a text for advanced undergraduate or graduate courses on database management in general or transaction processing in particular

Time-Constrained Transaction Management Nandit R. Soparkar, Henry F. Korth, Abraham Silberschatz, 2012-12-06 Transaction processing is an established technique for the concurrent and fault tolerant access of persistent data While this technique has been successful in standard database systems factors such as time critical applications emerg ing technologies and a re examination of existing systems suggest that the performance functionality and applicability of transactions may be substan tially enhanced if temporal considerations are taken into account That is transactions should not only execute in a legal i e logically correct man ner but they should meet certain constraints with regard to their invocation and completion times Typically these logical and temporal constraints are application dependent and we address some fundamental issues for the man agement of transactions in the presence of such constraints Our model for transaction processing is based on extensions to established mod els and we briefly outline how logical and temporal constraints may be ex pressed in it For scheduling the transactions we describe how legal schedules differ from one another in terms of meeting the temporal constraints Exist ing scheduling mechanisms do not differentiate among legal schedules and are thereby inadequate with regard to meeting temporal constraints This provides the basis for seeking scheduling strategies that attempt to meet the temporal constraints while continuing to produce legal schedules

Problems and Solutions to Transaction Processing Systems
Christian Rodiek, 2007-02-06 Essay from the year 2006 in the subject Business economics Information Management grade A Western Illinois University course Management of Information Technology language English abstract This report will discuss problems and solutions to transaction processing TP systems A brief introduction to the issue by defining and describing a transaction and a TP system is to give here before beginning with the core discussion A transaction in general implants changes made in the real world in a physical database 1 There fore business transactions are multiple basic operations involving exchanges cash credit information that have financial implications such as customer placing an order or someone paying parking tickets and they establish a connection between an organization and its database 3 A TP system is a form of data base management system that processes business transactions 1 Usually there exit several different systems in one organization Examples of TP applications are payroll inventory order processing reservations account processing in banks and stock trading 3 Considering the highly increased volume of transactions processed by organizations due to the credit card revolution and the Internet and their need to process the transactions in a timely fashion there arise several problems and performance constraints to the transaction

processing and its systems which need to be addressed To identify a certain performance of a TP system the Input Output I O of a system is a adequate measure In the following it will be assumed that the organizations already provide of Transaction Processing Facilities TPF that Main Memory Database Systems MMDS are not practical that most TP systems are already distributed i e that the organization have implemented a Distributed Database Management System DDMS and finally that the organizations have the fastest available computers networks already installed The Benchmark Handbook Jim Gray,1993 A practical guide that offers the reader a comprehensive view of benchmarking for modern transaction processing and database systems Much of the information is available for the first time The handbook provides the tools to evaluate different systems different software products on a single machine and different machines within a single product family

Transaction Processing on Modern Hardware Mohammad Sadoghi, Spyros Blanas, 2019-03-08

The last decade has brought groundbreaking developments in transaction processing This resurgence of an otherwise mature research area has spurred from the diminishing cost per GB of DRAM that allows many transaction processing workloads to be entirely memory resident This shift demanded a pause to fundamentally rethink the architecture of database systems The data storage lexicon has now expanded beyond spinning disks and RAID levels to include the cache hierarchy memory consistency models cache coherence and write invalidation costs NUMA regions and coherence domains New memory technologies promise fast non volatile storage and expose uncharted trade offs for transactional durability such as exploiting byte addressable hot and cold storage through persistent programming that promotes simpler recovery protocols In the meantime the plateauing single threaded processor performance has brought massive concurrency within a single node first in the form of multi core and now with many core and heterogeneous processors The exciting possibility to reshape the storage transaction logging and recovery layers of next generation systems on emerging hardware have prompted the database research community to vigorously debate the trade offs between specialized kernels that narrowly focus on transaction processing performance vs designs that permit transactionally consistent data accesses from decision support and analytical workloads In this book we aim to classify and distill the new body of work on transaction processing that has surfaced in the last decade to navigate researchers and practitioners through this intricate research subject
