Wireless Powered Communication Networks Abbas Jamalipour, Ying Bi, 2018-10-12 This textbook introduces *Wireless Powered Communication Networks*

WPCNs as a promising paradigm to overcome the energy bottleneck suffered by traditional wireless communication networks as well as emerging Internet of Things networks. It selectively spans a coherent spectrum of fundamental aspects in WPCNs such as wireless energy transfer WEH techniques, radio frequency RF energy harvesting, receiver model, simultaneous wireless information and power transfer SWIPT, as well as the rate energy tradeoff arising from the joint transmission of information and energy using the same waveform. It covers network models for WPCNs including the baseline and dual hop WPCN models and a variety of related extensions. This book further examines the key factors including throughput, fairness, and security that must be taken into account for impeccable operation of WPCNs. The new IoT applications are targeted as a key element in those factors. It will also include exercises and examples throughout the book as well as their PLS solutions. This is the first textbook examining the current research to provide a unified view of wireless power transfer WPT and information transmission in WPCNs from a physical layer security PLS perspective. Focused on designing efficient secure transmission schemes, analyzing energy evolution process, and evaluating secrecy outage performance under different channel state information CSI, the results presented in this book shed light on how to best balance security and throughput with prudent use of harvested energy in WPCNs. It also provides an overview of the WPCNs by introducing the background of WPT followed by a summary of the research conducted in the field. The authors describe the physical layer security PLS problem in WPCNs including the causes and the impacts of the problem on the performance of WPCNs. The authors extend the discussions by introducing the applications of WPCNs in the IoT. From the Internet of Things IoT point of view, this textbook reviews the opportunities and challenges for the lately emerged WPCN to seamlessly integrate into the IoT ecosystem. It specifically addresses the maximization problem of uplink and downlink sum throughput in a dual hop WPCN while taking fairness among WPCN users as a constraint. The results provided in this book reveal valuable insights into improving the design and deployment of future WPCNs in the upcoming IoT environment. This textbook targets advanced level students studying wireless communications and research engineers working in this field. Industry engineers in mobile device and network development business with an interest in WPCNs and IoT as well as their PLS solutions will also find this book useful.

Computer Communication Networks R.L.

Grimsdale,F.F. Kuo,1975-02-28 In 1968 the Advanced Research Projects Agency ARPA of the U S Department of Defense began implementation of a computer communication network which permits the interconnection of heterogeneous computers at geographically distributed centres through out the United States This network has come to be known as the ARPANET and has grown from the initial four node configuration in 1969 to almost forty nodes including satellite nodes in Hawaii Norway and London in late 1973 The major goal of ARPANET is to achieve resource sharing among the network users The resources to be shared include not only programs but also unique facilities such as the powerful ILLIAC IV computer and large global weather data bases that are economically feasible when widely shared The ARPANET employs a distributed store and forward packet switching approach that is much better suited for computer communications networks than the more conventional circuit switching approach Reasons favouring packet switching include lower cost higher capacity greater reliability and minimal delay All of these factors are discussed in these Proceedings
