Brown Algae:

Biology and biochemistry of host-pathogen interactions in marine brown algae Frithjof Christian

Küpper, 2020-10-13 Associations of marine algae with symbiotic or parasitic microorganisms are ubiquitous phenomena known for a long time. However, there is an almost complete lack of knowledge on details of such interactions. The intention of this study is to use the potentials of modern biological and biochemical techniques in order to analyze the reaction of brown algal hosts to the attack by pathogens and epibionts. A 3-year field study at different localities on the European Atlantic coast revealed that *Pylaiella littoralis* populations were subject to massive epidemics of the parasites *Eurychasma dicksonii*, *Chytridium polysiphoniae*, and *Anisolpidium rosenvingei*. Laboratory cultures were used to investigate the association of *Eurychasma* and *Chytridium* with brown algal hosts from different taxonomic groups. *Eurychasma* has a much broader host range than *Chytridium*, comprising members of all brown algal orders investigated and it tolerates a wider range of temperatures than the latter. Phylogenetic studies based upon 18 S rRNA genes revealed that *Eurychasma dicksonii* belongs to the Oomycota, branching at an ancestral position between terrestrial plant pathogens and free-living members of the marine heterotrophic picoplankton. *Chytridium polysiphoniae*, a fungus, appears more closely related to the genera *Rhizophyidium* and *Spizellomyces* (Chytridiomycota) than to other known *Chytridium* species. *Chytridium* produces chitin, whilst *Eurychasma* does not. Early stages of *Eurychasma* infection have a rather modest effect on host physiology. The photosynthetic capacity is enhanced, suggesting a temporary stimulation of host metabolism for hypertrophic growth. *Chytridium*, in contrast, has an immediate detrimental effect on host photosynthesis, which breaks down once a cell is infected, leading to the rapid death of infected cells.

Biochemical and Environmental Bioprocessing M. Jerold, V. Sivasubramanian, 2019-07-25 The rapid growth of industries has resulted in the generation of high volume of solid and liquid waste. Today there is a need of Clean and Green technology for the sustainable waste management. *Biochemical and Environmental Bioprocessing: Challenges and Developments* explore the state-of-art green technologies to manage the waste and to recover value-added products. Microbes play an important role in the bioremediation. Bioprocess engineering, an interdisciplinary, connects the Science and Technology. The bioconversion and bioremediation is essentially required for the management of various hazardous substances in the environment. This book will give an intensive knowledge on the application of Biochemical and Bioprocess technologies for the eco-friendly management of pollution. This book serves as a fundamental to the students, researchers, academicians, and Engineers working in the area of Environmental Bioremediation and in the exploration of various bioproducts from waste.
