Handbook of Constraint Programming Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18 Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications [Progress in Artificial Intelligence: Knowledge Extraction, Multi-agent Systems, Logic Programming, and Constraint Solving](#) Pavel Brazdil, Alipio Jorge, 2003-07-31 The tenth Portuguese Conference on Artificial Intelligence EPIA 2001 was held in Porto and continued the tradition of previous conferences in the series It returned to the city in which the first conference took place about 15 years ago The conference was organized as usual under the auspices of the Portuguese Association for Artificial Intelligence APPIA <http://www.appia.pt> EPIA maintained its international character and continued to provide a forum for presenting and discussing research on different aspects of Artificial Intelligence To promote motivated discussions among participants this conference strengthened the role of the thematic

workshops These were not just satellite events but rather formed an integral part of the conference with joint sessions when justified This had the advantage that the work was presented to a motivated audience This was the first time that EPIA embarked on this experience and so provided us with additional challenges

A Classical Approach to Artificial Intelligence Munesh Chandra Trivedi, There are many books available in the market on the proposed topic but none of them can be termed as comprehensive Besides students face many problems in understanding the language of these books Keeping these points in mind Artificial Intelligence was prepared which should be simple enough to comprehend and comprehensive enough to encompass all the topics of different institutions and universities *Handbook of Satisfiability* Armin Biere, 2009

Satisfiability SAT related topics have attracted researchers from various disciplines logic applied areas such as planning scheduling operations research and combinatorial optimization but also theoretical issues on the theme of complexity and much more they all are connected through SAT My personal interest in SAT stems from actual solving The increase in power of modern SAT solvers over the past 15 years has been phenomenal It has become the key enabling technology in automated verification of both computer hardware and software Bounded Model Checking BMC of computer hardware is now probably the most widely used model checking technique The counterexamples that it finds are just satisfying instances of a Boolean formula obtained by unwinding to some fixed depth a sequential circuit and its specification in linear temporal logic Extending model checking to software verification is a much more difficult problem on the frontier of current research One promising approach for languages like C with finite word length integers is to use the same idea as in BMC but with a decision procedure for the theory of bit vectors instead of SAT All decision procedures for bit vectors that I am familiar with ultimately make use of a fast SAT solver to handle complex formulas Decision procedures for more complicated theories like linear real and integer arithmetic are also used in program verification Most of them use powerful SAT solvers in an essential way Clearly efficient SAT solving is a key technology for 21st century computer science I expect this collection of papers on all theoretical and practical aspects of SAT solving will be extremely useful to both students and researchers and will lead to many further advances in the field

Constraint Logic Programming using Eclipse Krzysztof R. Apt, Mark Wallace, 2006-12-21 Constraint logic programming lies at the intersection of logic programming optimisation and artificial intelligence It has proved a successful tool in many areas including production planning transportation scheduling numerical analysis and bioinformatics Eclipse is one of the leading software systems that realise its underlying methodology Eclipse is exploited commercially by Cisco and is freely available and used for teaching and research in over 500 universities This book has a two fold purpose It is an introduction to constraint programming appropriate for one semester courses for upper undergraduate or graduate students in computer science or for programmers wishing to master the practical aspects of constraint programming By the end of the book the

reader will be able to understand and write constraint programs that solve complex problems Second it provides a systematic introduction to the Eclipse system through carefully chosen examples that guide the reader through the language and illustrate its power versatility and utility
