**Computer Architectures for Spatially Distributed Data** Herbert Freeman,G.G. Pieroni,2013-11-09 These are the proceedings of a NATO Advanced Study Institute ASI held in Cetraro Italy during 6 17 June 1983 The title of the ASI was Computer Arehiteetures for SpatiaZZy vistributed Vata and it brought together some 60 participants from Europe and America Presented ere are 21 of the lectures that were delivered The articles cover a wide spectrum of topics related to computer architecture s specially oriented toward the fast processing of spatial data and represent an excellent review of the state of the art of this topic For more than 20 years now researchers in pattern recognition image processing meteorology remote sensing and computer engineering have been looking toward new forms of computer architectures to speed the processing of data from two and three dimensional processes The work can be said to have commenced with the landmark article by Steve Unger in 1958 and it received a strong forward push with the development of the ILIAC III and IV computers at the University of Illinois during the 1960 s One clear obstacle faced by the computer designers in those days was the limitation of the state of the art of hardware when the only switching devices available to them were discrete transistors As aresult parallel processing was generally considered to be imprae tial and relatively little progress was made

*Digital Image Warping* George Wolberg,1990-08-10 This best selling original text focuses on image reconstruction real time texture mapping separable algorithms two pass transforms mesh warping and special effects The text containing all original material begins with the history of the field and continues with a review of common terminology mathematical preliminaries and digital image acquisition Later chapters discuss equations for spatial information interpolation kernels filtering problems and fast warping techniques based on scanline algorithms

*Special Computer Architectures for Pattern Processing* King-Sun Fu, 2018-05-04 It has been recognized for a long time that a conventional sequential processor is inefficient for operations on pictorial data where relatively simple operations need to be performed on a large number of data elements pixels Though many parallel processing architectures for picture processing have been proposed in the past very few have actually been implemented due to the costs involved With LSI technology it is becoming possible to realize parallel architectures at a modest cost In the following the authors review some of the proposed architectures for pattern recognition and image processing
