Computer Analysis Of Visual Textures:

Computer Analysis of Visual Textures Fumiaki Tomita, Saburo Tsuji, 2013-11-11 This book presents theories and techniques for perception of textures by computer Texture is a homogeneous visual pattern that we perceive in surfaces of objects such as textiles tree barks or stones Texture analysis is one of the first important steps in computer vision since texture provides important cues to recognize real world objects A major part of the book is devoted to two dimensional analysis of texture patterns by extracting statistical and structural features It also deals with the shape from texture problem which addresses recovery of the three dimensional surface shapes based on the geometry of projection of the surface texture to the image plane Perception is still largely mysterious Realizing a computer vision system that can work in the real world requires more research and experiment Capability of textural perception is a key component We hope this book will contribute to the advancement of computer vision toward robust useful systems We would like to express our appreciation to Professor Takeo Kanade at Carnegie Mellon University for his encouragement and help in writing this book to the members of Computer Vision Section at Electrotechnical Laboratory for providing an excellent research environment and to Carl W Harris at Kluwer Academic Publishers for his help in preparing the manuscript [Computer Analysis of Visual Textures](#)

Synthesis of Visual Texture, 1973 Computer methods are presented which deal with the problems of visual texture specifically Texture Analysis and Texture Synthesis The Decision Theory Method as its name indicates is based on the principles of statistical decision theory This method in conjunction with the Interval Covering Theory automatically generates a set of interval complexes which act as 2 D filters that detect texture features in the scene of analysis The versatility of this method to deal with various problems of visual texture such as scene segmentation using textural information extraction of texture borders discrimination recognition of both spatially and chromatically textured scenes etc is demonstrated A model is proposed that views the pixels of a digitized textural scene as a two way seasonal time series Based on this model a method is developed for synthesis of natural looking textures This method possesses a desirable quality that the parameters needed for the synthesis are derived from the analysis of parent texture i e the texture to be imitated Extending the concepts of two dimensional formal grammars known as array grammars multilevel array grammars are introduced These are shown capable of generating complex texture scenes specifically brickwall type texture that is those textures which are perceived at many levels and at each level they can be either structural or statistical A way of specifying these grammars for texture scenes in real cases with the help of interval complexes is also indicated 96 references auth *Visual Informatics: Bridging Research and Practice* Halimah Badioze Zaman, Peter Robinson, Maria Petrou, Patrick Olivier, Heiko Schröder, 2009-11-02 This book constitutes the refereed proceedings of the First International Visual Informatics Conference IVIC 2009 held in Kuala Lumpur Malaysia in November 2009 The 82 revised research papers presented together with four invited keynote papers were carefully reviewed and selected from 216 submissions The papers are organized in topical sections on virtual technologies and systems virtual environment visualization engineering and simulation as well as visual culture services and society
