

Circulatory System

Key Words:

Heart- Primary organ in the circulatory system. Used to pump blood to the body.

Atrium- The upper chambers in the heart that collect blood from the rest of the body.

Ventricle- The chambers in the heart that send blood out to the rest of the body.

Arteries- Blood vessels that carry oxygen rich blood to the rest of the body.

4. The heart has multiple chambers in order to deliver the blood to the different parts of the body. There are four chambers in the heart with each set of chambers having a specific name. The two upper chambers are called the **atria**s. The atriums collect the blood from the rest of the body. The bottom chambers are called **ventricles** and they will send the blood out of the heart. With the left atrium collecting oxygen rich blood from the lungs to be transported to the rest of the body by the left ventricle. The right atrium collects the deoxygenated blood from the body that will then be sent back to the lungs through the right ventricle.

5. Once the blood has left the heart through the left ventricle, it will make its way into the blood vessel known as an artery. You can easily think of the blood vessels as streets and the blood cells being like mail carriers who need to drop off important packages. The houses would represent cells who are receiving packages and sending packages back out.

As you read...

Contrast: What is the difference between a ventricle and an atrium?

Compare: What do all atriums do inside of the heart?

In the text: What type of tissue does the blood go into once it leaves the heart?
