

Introduction

Protozoa are microscopic, one-celled organisms that can be free living or parasitic in nature. They are able to multiply in humans, which contributes to their survival and also permits serious infections to develop from just a single organism. Transmission of protozoa that live in a human's intestine to another human typically occurs through a fecal-oral route (for example, contaminated food or water or person-to-person contact). Protozoa that live in the blood or tissue of humans are transmitted to other humans by an arthropod vector (for example, through the bite of a mosquito or sand fly). Some species of protozoans are abundantly found in soil. Some protozoans are helpful in keeping water clean but there are also some protozoans which pollute the water. **It is always necessary to avoid all situations between the organisms and their hosts under such circumstances.** This interaction is referred to as infection, the manifestation of which is always the infectious disease.

Biochemical and microbial interrelationships are dealt with fully with an emphasis on the integrated nature of the rumen contents. The book concludes by considering the most fruitful approaches that might lead to a more complete understanding of this complex and efficient organ. Each chapter is a complete unit that can be read and understood without reference to other chapters. A general reading list at the end of each chapter together with more detailed references will help to launch the student into any specific area of rumen studies.
