Networks* R.L. Grimsdale,F.F. Kuo,1975-02-28 In 1968 the Advanced Research Projects Agency ARPA of the U S Department  
of Defense began implementation of a computer communication network which permits the interconnection of heter  
ogeneous computers at geographically distributed centres through out the United States This network has come to be known  
as the ARPANET and has grown from the initial four node configuration in 1969 to almost forty nodes including satellite  
nodes in Hawaii Norway and London in late 1973 The major goal of ARPANET is to achieve resource sharing among the  
network users The resources to be shared include not only programs but also unique facilities such as the powerful ILLIAC IV  
computer and large global weather data bases that are economically feasible when widely shared The ARPANET employs a  
distributed store and forward packet switching approach that is much better suited for computer communications networks  
than the more conventional circuit switching approach Reasons favouring packet switching include lower cost higher  
capacity greater reliability and minimal delay All of these factors are discussed in these Proceedings Proceedings ,1978
