Repeated Measures Design with Generalized Linear Mixed Models for Randomized Controlled Trials Toshiro Tango, 2017-09-14 Repeated Measures Design with Generalized Linear Mixed Models for Randomized Controlled Trials is the first book focused on the application of generalized linear mixed models and its related models in the statistical design and analysis of repeated measures from randomized controlled trials The author introduces a new repeated measures design called S T design combined with mixed models as a practical and useful framework of parallel group RCT design because of easy handling of missing data and sample size reduction The book emphasizes practical rather than theoretical aspects of statistical analyses and the interpretation of results It includes chapters in which the author describes some old fashioned analysis designs that have been in the literature and compares the results with those obtained from the corresponding mixed models The book will be of interest to biostatisticians researchers and graduate students in the medical and health sciences who are involved in clinical trials Author Website Data sets and programs used in the book are available at <http://www.medstat.jp/download/repeatedcrc.html>

Statistical Experiment Design and Interpretation Claire A. Collins, Frances M. Seeney, 1999-08-25

Clearly written and free of statistical jargon this invaluable guide concentrates on the

practicalities of statistical analysis for anyone involved with agricultural research. Each section starts with the key points giving a quick reference to the contents and plenty of examples using real data. Successful experiment design starts with a statement of aims. The authors guide the reader through planning an experiment including defining objectives, considering treatments, measurements of interest, and the time and timing of assessments. Advantages and disadvantages of different experiment designs and the importance of data exploration and graphical presentation are covered, as are data collection, storage, validation, and verification. Statistical techniques include the t test, analysis of variance, basic regression analysis, and non-parametric techniques. Assumptions inherent to these techniques are clearly identified, bearing in mind the principles and aims without losing the reader in statistical theory. All of the techniques are illustrated with worked examples and give full interpretation of the results. Formulae are kept to a minimum in the main text but are given in full in the appendix. *Journal of Official Statistics*, 1988

Nonparametric Analysis of Longitudinal Data in Factorial Experiments Edgar Brunner, Sebastian Domhof, Frank Langer, 2002. The authoritative reference on nonparametric methods for evaluating longitudinal data in factorial designs. Broadening the range of techniques that can be used to evaluate longitudinal data, *Nonparametric Analysis of Longitudinal Data in Factorial Experiments* presents nonparametric methods of evaluation that supplement the generalized linear models approach. Emphasizing the practical application of these methods in statistical procedures, this book provides a unified approach for the analysis of factorial designs involving longitudinal data that is appropriate for metric data, count data, ordered categorical data, and dichotomous data. Topics covered include nonparametric models, effects, and hypotheses in experimental design; estimators for relative effects; experiments for one and several groups of subjects; multifactorial experiments; dependent replications; and experiments with numerous time points. The basic mathematical principles for the methods introduced here are described in theory consistent with the book's minimal math requirements. Simple approximations for small data sets are provided, as well as ample chapter exercises to test skills, an appendix that includes original data for the examples used throughout the book, and downloadable SAS IML macros for implementing the more extensive calculations. All applications are designed to be useful in many fields. Generously supplemented with more than 110 graphs and tables, *Nonparametric Analysis of Longitudinal Data in Factorial Experiments* is an essential reference for statisticians and biometricians, researchers in clinical trials, psychological studies, and in the fields of forestry, agriculture,
