Combinatorial Algebraic Geometry Gregory G. Smith, Bernd Sturmfels, 2017-11-17 This volume consolidates selected articles from the 2016 Apprenticeship Program at the Fields Institute part of the larger program on Combinatorial Algebraic Geometry that ran from July through December of 2016 Written primarily by junior mathematicians the articles cover a range of topics in combinatorial algebraic geometry including curves surfaces Grassmannians convexity abelian varieties and moduli spaces This book bridges the gap

between graduate courses and cutting edge research by connecting historical sources computation explicit examples and new results

Geometric Algorithms and Combinatorial Optimization Martin Grötschel, Laszlo Lovasz, Alexander Schrijver, 2012-12-06 Historically there is a close connection between geometry and optimization This is illustrated by methods like the gradient method and the simplex method which are associated with clear geometric pictures In combinatorial optimization however many of the strongest and most frequently used algorithms are based on the discrete structure of the problems the greedy algorithm shortest path and alternating path methods branch and bound etc In the last several years geometric methods in particular polyhedral combinatorics have played a more and more profound role in combinatorial optimization as well Our book discusses two recent geometric algorithms that have turned out to have particularly interesting consequences in combinatorial optimization at least from a theoretical point of view These algorithms are able to utilize the rich body of results in polyhedral combinatorics The first of these algorithms is the ellipsoid method developed for nonlinear programming by N Z Shor D B Yudin and A S Nemirovskii It was a great surprise when L G Khachiyan showed that this method can be adapted to solve linear programs in polynomial time thus solving an important open theoretical problem While the ellipsoid method has not proved to be competitive with the simplex method in practice it does have some features which make it particularly suited for the purposes of combinatorial optimization The second algorithm we discuss finds its roots in the classical geometry of numbers developed by Minkowski This method has had traditionally deep applications in number theory in particular in diophantine approximation
