Control Of Structures:

Integrated Passive and Active Control of Structures Vernon H. Neubert, 1993 A combination of passive damping and active control is needed on practical structures where sufficient modal damping is not achievable with passive damping alone The modal theories for structural equations in state space are reviewed and some eigenvector relationship are presented which are not available elsewhere for use later in the report Methods for determining sensitivities of eigenvalues and eigenvectors to plant matrix and control inputs are summarized and numerical examples are presented Procedures are developed for optimizing passive damping through use of the sensitivities of the eigenproperties for free vibration and forced random vibrations Frequency dependent behavior of viscoelastic damping material by curve fitting is discussed which is then used in an overdamped mini oscillator technique for analysis of an example ten bar truss Two approaches are presented for designing the combination of passive viscous damping and full state feedback control The first is iterative and makes use of eigenvalue sensitivities The second is based on a perturbation formulation where the desired changes in eigenvalues and eigenvectors are specified and the corresponding changes in the closed loop characteristic matrix in state space are predicted Restrictions on the choice of eigenvalues and eigenvectors are discussed in light of related literature on eigenstructure assignment Fortran computer programs one coupled with the constrained function minimization program CONMIN have been written for each type of problem Space structures Passive damping Active control Analysis Numerical examples

Vibration Control for Building Structures Aiqun Li, 2020-05-16 This book presents a comprehensive introduction to the field of structural vibration reduction control but may also be used as a reference source for more advanced topics The content is divided into four main parts the basic principles of structural vibration reduction control structural vibration reduction devices structural vibration reduction design methods and structural vibration reduction engineering practices As the book strikes a balance between theoretical and practical aspects it will appeal to researchers and practicing engineers alike as well as graduate students

Active Control of Structures Andre Preumont, Kazuto Seto, 2008-11-20 With Active Control of Structures two global pioneers present the state of the art in the theory design and application of active vibration control As the demand for high performance structural systems increases so will the demand for information and innovation in structural vibration control this book provides an effective treatise of the subject that will meet this requirement The authors introduce active vibration control through the use of smart materials and structures semi active control devices and a variety of feedback options they then discuss topics including methods and devices in civil structures modal analysis active control of high rise buildings and bridge towers active tendon control of cable structures and active and semi active isolation in mechanical structures Active Control of Structures Discusses new types of vibration control methods and devices including the newly developed reduced order physical modelling method for structural control Introduces triple high rise buildings connected by active control bridges as devised by Professor Seto Offers a design strategy from modelling to controller design

Vibration Control of Active Structures A. Preumont, 2012-10-29 I was introduced to structural control by Raphael Haftka and Bill Hallauer during a one year stay at the Aerospace and Ocean Engineering department of Virginia Tech during the academic year 1985-1986 At that time there was a tremendous interest in large space structures in the USA mainly because of the Strategic Defense Initiative and the space station program Most of the work was theoretical or numerical but Bill Hallauer was one of the few experimentalists trying to implement control systems which worked on actual structures When I returned to Belgium I was appointed at the chair of Mechanical Engineering and Robotics at ULB and I decided to start some basic vibration control experiments on my own A little later smart materials became widely available and offered completely new possibilities particularly for precision structures but also brought new difficulties due to the strong coupling in their constitutive equations which requires a complete reformulation of the classical modelling techniques such as finite elements We started in this new field with the support of the national and regional governments the European Space Agency and some bilateral collaborations with European aerospace companies Our Active Structures Laboratory was inaugurated in October 1995 Electrical Engineering, 1911 **Proceedings ...
