Abstract

This report aims at giving a *short* overview on rank function analysis of authentication protocols concentrating on the results of Schneider in [4] and Heather in [2]. Therefore it shows a standard form of protocol implementation in CSP, shows how authentication properties can be captured as trace specifications, gives basic definitions necessary to reason about the unbounded set of messages, reformulates the central rank function theorem and restates its proof. Additionally it gives hints on applying this approach to verify secrecy protocols as well, a *short* overview on tool support available and some hints on interesting properties of rank functions.

This report will use notations introduced in earlier reports [11-16] throughout and only reintroduce notations where they are considered vital.

Design And Validation Of Computer Protocols:

Design and Validation of Computer Protocols Gerard J. Holzmann, 1991 More than just a guide to protocol standards codes and formats this text offers a systematic approach for designing complete and consistent protocol systems with the power to govern the interactions of concurrent processes in distributed systems Specifically intended as a guide to protocol design and analysis the text familiarizes readers with all the issues of protocol design including general and specific techniques for process coordination

Design and Validation of Computer Protocols Gerard J. Holzmann, 1991 This volume discusses the fundamental problems of designing logically consistent methods of communication between multiple computer processes Standard protocol design problems such as error control and flow control are covered in detail but also structured design methods and the construction of formal validation models The book contains complete listings and explanations of new protocol validation and design tool called SPIN Author is in charge of protocol design at Bell Labs Professionals who bought Tanenbaum's COMPUTER NETWORKS 2 E and Comer's TCP IP will buy this This is the first book to cover automated protocol design and validation tools extensively

Agent-Oriented Software Engineering V James Odell, Paolo Giorgini, Jörg, P. Müller, 2005-01-24 The explosive growth of application areas such as electronic commerce enterprise resource planning and mobile computing has profoundly and irreversibly changed our views on software systems Nowadays software is to be based on open architectures that continuously change and evolve to accommodate new components and meet new requirements Software must also operate on different platforms without recompilation and with minimal assumptions about its operating environment and its users Furthermore software must be robust and autonomous capable of serving a naive user with a minimum of overhead and interference Agent concepts hold great promise for responding to the new realities of software systems They offer higher level abstractions and mechanisms which address issues such as knowledge representation and reasoning communication coordination cooperation among heterogeneous and autonomous parties perception commitments goals beliefs and intentions all of which need conceptual modelling On the one hand the concrete implementation of these concepts can lead to advanced functionalities e.g. in inference based query answering transaction control adaptive workflows brokering and integration of disparate information sources and automated communication processes On the other hand their rich representational capabilities allow more faithful and flexible treatments of complex organizational processes leading to more effective requirements analysis and architectural detailed design
