Avian Genetics A Population And Ecological Approach:

Avian Genetics F. Cooke, P. A. Buckley, 2013-09-24 *Avian Genetics A Population and Ecological Approach* is a collection of papers that deals with the study of birds in relation to the synthetic theory of evolution. This book studies the ecology, demography, behavior, and geographical distribution of birds. The text also discusses quantitative, chromosomal, biochemical, and population genetics. Part I reviews the various genetic interactions, including an analysis of DNA sequence variation. The different and newer techniques are compared, such as the works of Sibley, Quinn, and White. Part II describes the molding of genetic variation and covers topics such as inbreeding, gene flow, and the genetic structure of populations, non-random mating, and the process of selection in natural populations of birds. Part III covers actual genetic case histories, including quantitative ecological genetics of great tits, genetic evolution of house sparrows, and presentation of evidence for sexual selection by female choice in the Arctic Skua. This book also presents future research in subjects such as the neutrality selection controversy, or genetics and conservation. This text can be beneficial for ecologists, ornithologists, animal conservationists, and population biologists studying birds.

Wildlife 2001: Populations D.R. McCullough, R.H. Barrett, 2012-12-06

In 1984, a conference called *Wildlife 2000: Modeling habitat relationships of terrestrial vertebrates* was held at Stanford Sierra Camp at Fallen Leaf Lake in the Sierra Nevada Mountains of California. The conference was well received and the published volume, Verner, J. M. L. Morrison, and C. J. Ralph, editors, 1986, *Wildlife 2000: Modeling habitat relationships of terrestrial vertebrates*, University of Wisconsin Press, Madison, Wisconsin, USA, proved to be a landmark publication that received a book award by The Wildlife Society. *Wildlife 2001: Populations* was a follow-up conference with emphasis on the other major biological field of wildlife conservation and management, populations. It was held on July 29-31, 1991, at the Oakland Airport Hilton Hotel in Oakland, California, in accordance with our intent that this conference have a much stronger international representation than did *Wildlife 2000*. The goal of the conference was to bring together an international group of specialists to address the state of the art in wildlife population dynamics and set the agenda for future research and management on the threshold of the 21st century. The mix of specialists included workers in theoretical as well as practical aspects of wildlife conservation and management. Three general sessions covered methods, modelling, and conservation of threatened species.

Evolutionary Dynamics of a Natural Population B. Rosemary Grant, Peter R. Grant, 1989-11-14

The result of one of the most detailed and careful examinations of the behavior and ecology of a vertebrate ever conducted in the wild, this study addresses one of the major questions in evolutionary biology: why do some populations vary so much in morphological, ecological, behavioral, and physiological traits? By documenting the full range of variation within one population of a species and investigating the causal factors, Rosemary and Peter Grant provide impressive evidence that species are capable of evolutionary change within observable periods of time. Among the most dramatic examples of recent speciation and adaptive diversification are Darwin's Finches, which live in the Galapagos Islands.

Darwin theorized that these closely related birds had evolved from a common ancestor to fill the available ecological niches on this remote archipelago. Not only have they evolved into thirteen species but more recent study has shown that many of them exhibit striking variation in beak structure and other traits. For more than a decade the Grants have studied one of these species, the large cactus finch, on the isolated Isla Genovesa. They present information on the environment and demographic features of the population, then discuss the range of genetic, ecological, and behavioral factors responsible for the unusually large morphological variation. They place the large cactus finch in its community setting to better understand its evolution and conclude by discussing the implications of the study for the genetic structure of small populations and the problems of conserving them. They illustrate their findings with an array of drawings, tables, and photographs.

Seabird Populations David N. Nettleship, David Cameron Duffy, 1992 **Population Genetic Structure of Understory Birds in a Fragmented Tropical Rainforest** Laura MacAlister Brown, 2000 *Movement Patterns and Population Structure of Harlequin Ducks Wintering in the Strait of Georgia, British Columbia* Heidi M. Regehr, 2003 I investigated winter movement patterns and population structure of Harlequin Ducks (*Histrionicus histrionicus*) in the Strait of Georgia, British Columbia, Canada. Because of winter pairing, delayed maturation, and long-term pair bonds, movement patterns at wintering areas, particularly those of young birds that have not yet paired, are important to population structure. I used nasal and radio marking to determine movement distances and multi-stratum models in capture-mark-recapture analysis to estimate movement rates among locations. I provide evidence that Harlequin Duck broods accompany their mothers from breeding streams to coastal wintering areas. Behavioural observations of family-like groups at the coast and genetic analysis of blood samples from putative family members suggested that observed groups were true families. Family migration in combination with philopatry in the absence of dispersal would lead to juvenile recruitment into the wintering populations of their relatives and potentially to genetic and demographically isolated populations. Winter movement distances and rates did not differ by sex, likely due to extreme philopatry of paired males, slightly reduced philopatry of unpaired males, and intermediate philopatry of previously paired females. However, they did differ by age, with young birds in their first and second winters dispersing greater distances and at higher rates than older individuals. Isolation by distance and stepping-stone gene flow models generated estimates for the among-population component of genetic variance of less than 1% for the Strait of Georgia. Thus, due to dispersal of young individuals, which counteracts the isolating effects of philopatry and family migration, groups of Harlequin Ducks are unlikely to be genetically distinct at this scale. However, estimates from the stepping-stone model for an increased number of colonies did suggest that, due to their linear coastal distribution, genetic differences could develop at the scale of their entire west coast of North America wintering range. Low movement rates between the northern and southern Strait of Georgia suggested that groups of wintering birds may be demographically distinct at this scale, and dispersal by both sexes indicated that recolonization or rescue of extinct or reduced groups is likely. **Canadian Journal**
