Contemporary Combinatorics:

Contemporary Combinatorics Bela Bollobas, 2002-05-28 This volume is a collection of survey papers in combinatorics that have grown out of lectures given in the workshop on Probabilistic Combinatorics at the Paul Erdős Summer Research Center in Mathematics in Budapest The papers reflecting the many facets of modern day combinatorics will be appreciated by specialists and general mathematicians alike assuming relatively little background each paper gives a quick introduction to an active area enabling the reader to learn about the fundamental results and appreciate some of the latest developments An important feature of the articles very much in the spirit of Erdős is the abundance of open problems

Cylindric-like Algebras and Algebraic Logic Hajnal Andréka, Miklós Ferenczi, István Némethi, 2014-01-27 Algebraic logic is a subject in the interface between logic algebra and geometry it has strong connections with category theory and combinatorics Tarski's quest for finding structure in logic leads to cylindric like algebras as studied in this book they are among the main players in Tarskian algebraic logic Cylindric algebra theory can be viewed in many ways as an algebraic form of definability theory as a study of higher dimensional relations as an enrichment of Boolean Algebra theory or as logic in geometric form cylindric in the name refers to geometric aspects Cylindric like algebras have a wide range of applications in e.g natural language theory data base theory stochastics and even in relativity theory The present volume consisting of 18 survey papers intends to give an overview of the main achievements and new research directions in the past 30 years since the publication of the Henkin Monk Tarski monographs It is dedicated to the memory of Leon Henkin

New Trends in Intuitive Geometry Gergely Ambrus, Imre Bárány, Károly J. Böröczky, Gábor Fejes Tóth, János Pach, 2018-11-03 This volume contains 17 surveys that cover many recent developments in Discrete Geometry and related fields Besides presenting the state of the art of classical research subjects like packing and covering it also offers an introduction to new topological algebraic and computational methods in this very active research field The readers will find a variety of modern topics and many fascinating open problems that may serve as starting points for research

Geometry - Intuitive, Discrete, and Convex Imre Bárány, Károly Jr. Böröczky, Gábor Fejes Tóth, Janos Pach, 2015-04-09 The present volume is a collection of a dozen survey articles dedicated to the memory of the famous Hungarian geometer László Fejes Tóth on the 99th anniversary of his birth Each article reviews recent progress in an important field in intuitive discrete and convex geometry The mathematical work and perspectives of all editors and most contributors of this volume were deeply influenced by László Fejes Tóth

Building Bridges II Imre Bárány, Gyula O. H. Katona, Attila Sali, 2020-02-04 This volume collects together research and survey papers written by invited speakers of the conference celebrating the 70th birthday of László Lovász The topics covered include classical subjects such as extremal graph theory coding theory design theory applications of linear algebra and combinatorial optimization as well as recent trends such as extensions of graph limits online or statistical versions of classical combinatorial problems and new methods of derandomization László Lovász is one of the pioneers in the interplay between

discrete and continuous mathematics and is a master at establishing unexpected connections building bridges between seemingly distant fields His invariably elegant and powerful ideas have produced new subfields in many areas and his outstanding scientific work has defined and shaped many research directions in the last 50 years The 14 contributions presented in this volume all of which are connected to Lovász's areas of research offer an excellent overview of the state of the art of combinatorics and related topics and will be of interest to experienced specialists as well as young researchers

An Irregular Mind Imre Bárány, József Solymosi, 2011-02-11 Szemerédi's influence on today's mathematics especially in combinatorics additive number theory and theoretical computer science is enormous This volume is a celebration of Szemerédi's achievements and personality on the occasion of his seventieth birthday It exemplifies his extraordinary vision and unique way of thinking A number of colleagues and friends all top authorities in their fields have contributed their latest research papers to this volume The topics include extension and applications of the regularity lemma the existence of k term arithmetic progressions in various subsets of the integers extremal problems in hypergraphs theory and random graphs all of them beautiful Szemerédi type mathematics It also contains published accounts of the first two very original and highly successful Polymath projects one led by Tim Gowers and the other by Terry Tao

Contact and Symplectic Topology Frédéric Bourgeois, Vincent Colin, András Stipsicz, 2014-03-10 Symplectic and contact geometry naturally emerged from the mathematical description of classical physics The discovery of new rigidity phenomena and properties satisfied by these geometric structures launched a new research field worldwide The intense activity of many European research groups in this field is reflected by the ESF Research Networking Programme Contact And Symplectic Topology CAST The lectures of the Summer School in Nantes June 2011 and of the CAST Summer School in Budapest July 2012 provide a nice panorama of many aspects of the present status of contact and symplectic topology The notes of the minicourses offer a gentle introduction to topics which have developed in an amazing speed in the recent past These topics include 3 dimensional and higher dimensional contact topology Fukaya categories asymptotically holomorphic methods in contact topology bordered Floer homology embedded contact homology and flexibility results for Stein manifolds

Deformations of Surface Singularities András Némethi, Agnes Szilárd, 2014-01-24 The present publication contains a special collection of research and review articles on deformations of surface singularities that put together serve as an introductory survey of results and methods of the theory as well as open problems and examples The aim is to collect material that will help mathematicians already working or wishing to work in this area to deepen their insight and eliminate the technical barriers in this learning process Additionally we introduce some material which emphasizes the newly found relationship with the theory of Stein fillings and symplectic geometry This links two main theories of mathematics low dimensional topology and algebraic geometry The theory of normal surface singularities is a distinguished part of analytic or algebraic geometry with several important results its own technical machinery and several open problems Recently several connections were established with

low dimensional topology symplectic geometry and theory of Stein fillings This created an intense mathematical activity with spectacular bridges between the two areas The theory of deformation of singularities is the key object in these connections

Erdős Centennial László Lovász, Imre Ruzsa, Vera T. Sós, 2014-01-24 Paul Erdős was one of the most influential mathematicians of the twentieth century whose work in number theory combinatorics set theory analysis and other branches of mathematics has determined the development of large areas of these fields In 1999 a conference was organized to survey his work his contributions to mathematics and the far reaching impact of his work on many branches of mathematics On the 100th anniversary of his birth this volume undertakes the almost impossible task to describe the ways in which problems raised by him and topics initiated by him indeed whole branches of mathematics continue to flourish Written by outstanding researchers in these areas these papers include extensive surveys of classical results as well as of new developments

Optimal Transport on Quantum Structures Jan Maas, Simone Rademacher, Tamás Titkos, Dániel Virostek, 2024-09-19 The flourishing theory of classical optimal transport concerns mass transportation at minimal cost This book introduces the reader to optimal transport on quantum structures i e optimal transportation between quantum states and related non commutative concepts of mass transportation It contains lecture notes on classical optimal transport and Wasserstein gradient flows dynamics and quantum optimal transport quantum couplings and many body problems quantum channels and qubits These notes are based on lectures given by the authors at the Optimal Transport on Quantum Structures School held at the Erdős Center in Budapest in the fall of 2022 The lecture notes are complemented by two survey chapters presenting the state of the art in different research areas of non commutative optimal transport

Combinatorial techniques Sharad S. Sane, 2013-01-15 This is a basic text on combinatorics that deals with all the three aspects of the discipline tricks techniques and theory and attempts to blend them The book has several distinctive features Probability and random variables with their interconnections to permutations are discussed The theme of parity has been specially included and it covers applications ranging from solving the Nim game to the quadratic reciprocity law Chapters related to geometry include triangulations and Sperner's theorem classification of regular polytopes tilings and an introduction to the Euclidean Ramsey theory Material on group actions covers Sylow theory automorphism groups and a classification of finite subgroups of orthogonal groups All chapters have a large number of exercises with varying degrees of difficulty ranging from material suitable for Mathematical Olympiads to research

Surveys in Combinatorics 2024 Felix Fischer, Robert Johnson, 2024-06-13 This volume contains nine survey articles by the invited speakers of the 30th British Combinatorial Conference held at Queen Mary University of London in July 2024 Each article provides an overview of recent developments in a current hot research topic in combinatorics Topics covered include Latin squares Erdős covering systems finite field models sublinear expanders cluster expansion the slice rank polynomial method and oriented trees and paths in digraphs The authors are among the world's foremost researchers on their respective topics but their surveys are accessible to nonspecialist readers they are written

clearly with little prior knowledge assumed and with pointers to the wider literature Taken together these surveys give a snapshot of the research frontier in contemporary combinatorics helping researchers and graduate students in mathematics and theoretical computer science to keep abreast of the latest developments in the field **Bulletin of the Belgian**

Watkins, 2013-06-27 Who first presented Pascal's triangle It was not Pascal Who first presented Hamiltonian graphs It was not Hamilton Who first presented Steiner triple systems It was not Steiner The history of mathematics is a well studied and vibrant area of research with books and scholarly articles published on various aspects of the subject Yet the history of combinatorics seems to have been largely overlooked This book goes some way to redress this and serves two main purposes 1 it constitutes the first book length survey of the history of combinatorics and 2 it assembles for the first time in a single source researches on the history of combinatorics that would otherwise be inaccessible to the general reader Individual chapters have been contributed by sixteen experts The book opens with an introduction by Donald E Knuth to two thousand years of combinatorics This is followed by seven chapters on early combinatorics leading from Indian and Chinese writings on permutations to late Renaissance publications on the arithmetical triangle The next seven chapters trace the subsequent story from Euler's contributions to such wide ranging topics as partitions polyhedra and latin squares to the 20th century advances in combinatorial set theory enumeration and graph theory The book concludes with some combinatorial reflections by the distinguished combinatorialist Peter J Cameron This book is not expected to be read from cover to cover although it can be Rather it aims to serve as a valuable resource to a variety of audiences Combinatorialists with little or no knowledge about the development of their subject will find the historical treatment stimulating A historian of mathematics will view its assorted surveys as an encouragement for further research in combinatorics The more general reader will discover an introduction to a fascinating and too little known subject that continues to stimulate and inspire the work of scholars today
