Convergence Analysis Of Recurrent Neural Networks:

Convergence Analysis of Recurrent Neural Networks Zhang Yi, 2013-11-11 Since the outstanding and pioneering research work of Hopfield on recurrent neural networks RNNs in the early 80s of the last century neural networks have rekindled strong interests in scientists and researchers Recent years have recorded a remarkable advance in research and development work on RNNs both in theoretical research as well as actual applications The field of RNNs is now transforming into a complete and independent subject From theory to application from software to hardware new and exciting results are emerging day after day reflecting the keen interest RNNs have instilled in everyone from researchers to practitioners RNNs contain feedback connections among the neurons a phenomenon which has led rather naturally to RNNs being regarded as dynamical systems RNNs can be described by continuous time differential systems discrete time systems or functional differential systems and more generally in terms of non linear systems Thus RNNs have to their disposal a huge set of mathematical tools relating to dynamical system theory which has turned out to be very useful in enabling a rigorous analysis of RNNs

1995 IEEE International Conference on Neural Networks, ICNN'95 International Conference on Neural Networks 1995, Perth, Western Australia, 1995 **Using Fourier convergence analysis for effective learning in max- min neural networks** Kia Fock Loe, Loo-Nin Teow, 1996 Abstract Max and min operations have interesting properties that facilitate the exchange of information between the symbolic and real valued domains As such neural networks that employ max min activation functions have been a subject of interest in recent years Since max min functions are not strictly differentiable many ad hoc learning methods for such max min neural networks have been proposed in the literature In this technical report we propose a mathematically sound learning method based on using Fourier convergence analysis to derive a gradient descent technique for max min error functions This method is then applied to two models a feedforward fuzzy neural network and a recurrent max min neural network We show how a typical fuzzy neural network model employing max min activation functions can be trained to perform function approximation its performance was found to be better than that of a conventional feedforward neural network We also propose a novel recurrent max min neural network model which is trained to perform grammatical inference as an application example Comparisons are made between this model and recurrent neural networks that use conventional sigmoidal activation functions such recurrent sigmoidal networks are known to be difficult to train and generalize poorly on long strings The comparisons show that our model not only performs better in terms of learning speed and generalization its final weight configuration allows a DFQ to be extracted in a straightforward manner However it has a potential drawback the minimal network size required for successful convergence grows with increasing language depth and complexity Nevertheless we are able to demonstrate that our proposed gradient descent technique does allow max min neural networks to learn effectively Our learning method should be extensible to other neural networks that have non differentiable activation functions *IEEE Transactions on Circuits and Systems* ,2005 **Pattern Recognition and Image Analysis** ,2005 **APCCAS ...** ,1998 **Dynamics of Continuous, Discrete & Impulsive Systems** ,2009
