Recognition Joke Badejo,Tunji Ibiyemi,2013 Automatic speech recognition and speaker recognition have a lot of applications in personal identification access control and in the new man machine interface paradigm The existing applications in voice activated embedded systems solve the problem of recognition of the spoken words only or the problem of recognition of a speaker through the words uttered only The goal of this project therefore is the development of a robust algorithm for both speech recognition and speaker verification An example of a target application of this work is speech dialing of mobile phones with a speaker verification front end in order to effect access control In view of the memory and computational constraints of embedded systems the dynamic time warping algorithm is used This project only considers isolated spoken digits The developed algorithm is coded in C language and can be ported to firmware for Arabic numeral digit recognition with a speaker verification front end for an embedded system like mobile phones The system produced a FAR of 13.33% and a FRR of 24.3% for a total of 70 true claims and 30 false claims It also had a word accuracy of 96.7% **Automatic Speaker Recognition System for Telephone Speech** Chiwei Che,1998 **ICCCE 2019** Amit Kumar,Stefan

Human Language Technology. Challenges of the Information Society Zygmunt Vetulani,Hans Uszkoreit,2009-08-25 Half a century ago not many people had realized that a new epoch in the history of homo sapiens had just started The term Information Society Age seems an appropriate name for this epoch Communication was without a doubt a lever of the conquest of the human race over the rest of the animate world There is little doubt that the human race began when our predecessors started to communicate with each other using language This highly abstract means of communication was probably one of the major factors contributing to the evolutionary success of the human race within the animal world Physically weak and imperfect humans started to dominate the rest of the world through the creation of communication based societies where individuals communicated initially to satisfy immediate needs and then to create accumulate and process knowledge for future use The crucial step in the history of humanity was the invention of writing It is worth noting that writing is a human invention not a phenomenon resulting from natural evolution Humans invented writing as a technique for recording speech as well as for storing and facilitating the dissemination of knowledge across the world Humans continue to be born illiterate and therefore teaching and conscious supervised learning is necessary to maintain this basic social skill

Agent and Multi-Agent Systems: Technologies and Applications Geun Sik Jo,Lakhmi Jain,2008-04-03 Following from the very successful First KES Symposium on Agent and Multi Agent Systems

Technologies and Applications KES AMSTA 2007 held in Wroclaw Poland 31 May 1 June 2007 the second event in the KES AMSTA symposium series KES AMSTA 2008 was held in Incheon Korea March 26 28 2008 The symposium was organized by the School of Computer and Information Engineering Inha University KES International and the KES Focus Group on Agent and Multi agent Systems The KES AMSTA Symposium Series is a sub series of the KES Conference Series The aim of the symposium was to provide an international forum for scientific research into the technologies and applications of agent and multi agent systems Agent and multi agent systems are related to the modern software which has long been recognized as a promising technology for constructing autonomous complex and intelligent systems A key development in the field of agent and multi agent systems has been the specification of agent communication languages and formalization of ontologies Agent communication languages are intended to provide standard declarative mechanisms for agents to communicate knowledge and make requests of each other whereas ontologies are intended for conceptualization of the knowledge domain The symposium attracted a very large number of scientists and practitioners who submitted their papers for nine main tracks concerning the methodology and applications of agent and multi agent systems a doctoral track and two special sessions

Automatic Speech Analysis and Recognition Jean-Paul Haton, 2012-12-06 This book is the result of the second NATO Advanced Study Institute on speech processing held at the Chateau de Bonas France from June 29th to July 10th 1981 This Institute provided a high level coverage of the fields of speech transmission recognition and understanding which constitute important areas where research activity has recently been associated with actual industrial developments This book will therefore include both fundamental and applied topics Ten survey papers by some of the best specialists in the field are included They give an up to date presentation of several important problems in automatic speech processing As a consequence the book can be considered as a reference manual on some important areas of automatic speech processing The surveys are indicated by a in the table of contents This book also contains research papers corresponding to original works which were presented during the panel sessions of the Institute For the sake of clarity the book has been divided into five sections 1 Speech Analysis and Transmission An emphasis has been laid on the techniques of linear prediction LPC and the problems involved in the transmission of speech at various bit rates are addressed in details 2 Acoustics and Phonetics One of the major bottleneck in the development of speech recognition systems remains the transcription of the continuous speech wave into some discrete strings or lattices of phonetic symbols Two survey papers discuss this problem from different points of view and several practical systems are also described Human and Automatic Speaker Recognition over Telecommunication Channels Laura Fernández Gallardo, 2015-08-17 This work addresses the evaluation of the human and the automatic speaker recognition performances under different channel distortions caused by bandwidth limitation codecs and electro acoustic user interfaces among other impairments Its main contribution is the demonstration of the benefits of communication channels of extended bandwidth together with an insight into how speaker specific characteristics of speech

are preserved through different transmissions It provides sufficient motivation for considering speaker recognition as a criterion for the migration from narrowband to enhanced bandwidths such as wideband and super wideband

Rodman, Robert Rodman, 1997 Here s a scientific look at computer generated speech verification and identification its underlying technology practical applications and future direction You get a solid background in voice recognition technology to help you make informed decisions on which voice recognition based software to use in your company or organization It is unique in its clear explanations of mathematical concepts as well as its full chapter presentation of the successful new Multi Granular Segregating System for accurate context free speech identification

Automatic Speech Recognition Kai-Fu Lee, 1988-10-31 Speech Recognition has a long history of being one of the difficult problems in Artificial Intelligence and Computer Science As one goes from problem solving tasks such as puzzles and chess to perceptual tasks such as speech and vision the problem characteristics change dramatically knowledge poor to knowledge rich low data rates to high data rates slow response time minutes to hours to instantaneous response time These characteristics taken together increase the computational complexity of the problem by several orders of magnitude Further speech provides a challenging task domain which embodies many of the requirements of intelligent behavior operate in real time exploit vast amounts of knowledge tolerate errorful unexpected unknown input use symbols and abstractions communicate in natural language and learn from the environment Voice input to computers offers a number of advantages It provides a natural fast hands free eyes free location free input medium However there are many as yet unsolved problems that prevent routine use of speech as an input device by non experts These include cost real time response speaker independence robustness to variations such as noise microphone speech rate and loudness and the ability to handle non grammatical speech Satisfactory solutions to each of these problems can be expected within the next decade Recognition of unrestricted spontaneous continuous speech appears unsolvable at present However by the addition of simple constraints such as clarification dialog to resolve ambiguity we believe it will be possible to develop systems capable of accepting very large vocabulary continuous speech dictation
