## **Computational Models Of Learning:**

Computational Models of Learning Leonard Bolc,2012-12-06 In recent years machine learning has emerged as a significant area of research in artificial intelligence and cognitive science At present research in the field is being intensified from both the point of view of theory and of implementation and the results are being introduced in practice Machine learning has recently become the subject of interest of many young and talented scientists whose bold ideas have greatly contributed to the broadening of knowledge in this rapidly developing field of science This situation has manifested itself in an increasing number of valuable contributions to scientific journals However such papers are necessarily compact descriptions of research problems Computational Models of Learning supplements these contributions and is a collection of more extensive essays These essays provide the reader with an increased knowledge of carefully selected problems of machine learning

Langley,1987-10-26 Computational Modeling of Human Language Acquisition Afra Alishahi,2010-10-29 Human language acquisition has been studied for centuries but using computational modeling for such studies is a relatively recent trend However computational approaches to language learning have become increasingly popular mainly due to advances in developing machine learning techniques and the availability of vast collections of experimental data on child language learning and child adult interaction Many of the existing computational models attempt to study the complex task of learning a language under cognitive plausibility criteria such as memory and processing limitations that humans face and to explain the developmental stages observed in children By simulating the process of child language learning computational models can show us which linguistic representations are learnable from the input that children have access to and which mechanisms yield the same patterns of behaviour that children exhibit during this process In doing so computational modeling provides insight into the plausible mechanisms involved in human language acquisition and inspires the development of better language models and techniques This book provides an overview of the main research questions in the field of human language acquisition It reviews the most commonly used computational frameworks methodologies and resources for modeling child language learning and the evaluation techniques used for assessing these computational models The book is aimed at cognitive scientists who want to become familiar with the available computational methods for investigating problems related to human language acquisition as well as computational linguists who are interested in applying their skills to the study of child language acquisition Different aspects of language learning are discussed in separate chapters including the acquisition of the individual words the general regularities which govern word and sentence form and the associations between form and meaning For each of these aspects the challenges of the task are discussed and the relevant empirical findings on children are summarized Furthermore the existing computational

Lipscomb, 2020 This dissertation is organized around three articles concerned with the design learning and teaching of computational modeling They are designed as stand alone articles but when taken together they ask questions of and respond to one another to provide a consideration of the ways computational modeling can be used in science classrooms The first article is a systematic literature review conducted to determine key features of learning experiences that integrate computational models into science classes This literature review provides a look at the landscape of the field of computational modeling in regard to designing and researching learning experiences that integrate computer science CS practices into science classrooms The study explores the key features of the computational tools used in the integrated learning experiences ILEs as well as the ways they seem to influence students learning of modeling computational thinking and science content The review found that teacher led activities influence students learning as well as the features included in the computational tools The review also found that there is a gap in the literature concerning how students relate to CS after engaging in an ILE The second article investigated the ways that engaging in an ILE seemed to influence students CS identities using students written responses and video data The study found that aspects of students CS identities seemed to be related to students performance of computational tasks feelings of creative freedom while modeling views on collaboration and their mindsets about learning CS The study also found that students did not seem to connect their experiences in the ILE to any other of their lived experiences outside of computer related activities The third article investigates the instructional decisions a teacher made while implementing the ILE By comparing her implementation to the curriculum and conducting follow up interviews the characterized the many factors that interacted to influence the decisions a teacher made as she taught a practice that was new to her The study found that although the teacher s philosophies aligned with the curriculum her more immediate goals influenced her instructional decisions *Proceedings of the Eighteenth Annual Conference of the Cognitive Science Society* Garrison W. **A Time-varying Computational Model of Learning to Read Printed Words Aloud** Matthew James Cooper Borkenhagen, 2023 Computational models of naming words producing a phonological code from an orthographic one have been essential for understanding aspects of learning and performance related to reading and the bases of knowledge related to its development Historically computational models and the theoretical models from which they derive have focused on aspects of word reading that are relevant to the simplest words in English those with one syllable This has afforded vast and successful inquiry and debate relevant to understanding the various aspects of cognition and development relating to reading including its educational implications These models are limited however due to their narrow focus on the simplest words in

the language This dissertation aims to extend beyond these more limited scientific models in order to understand the time contingent processes that contribute to the development of skilled reading This is accomplished through the articulation of a time varying model of naming printed words made possible by specifying computational processes that take place over essential temporal aspects of learning and performance related to the act of reading words aloud namely those associated with audition and vision In addition to reporting on a novel computational learning system that learns to read words aloud this model is tested through a range of experiments that validate its legitimacy as a viable theoretical model of reading aloud and point to a number of new directions for experimentation and theorizing
