Earth's Climate Past and Future works as either a nonmajors introduction to Earth system science or climate change or as a majors graduate level overview of the processes and techniques in climate science Written from a multidisciplinary perspective by a researcher instructor in the field the text summarizes the major lessons to be learned from 550 million years of climate changes as a way of evaluating the climatological impact on and by humans in this century The book also looks ahead to possible effects during the next several centuries of fossil fuel use *The Global Climate System* Howard A. Bridgman, John E. Oliver, 2014-03-06

Over the last 20 years developments in climatology have provided an amazing array of explanations for the pattern of world climates This textbook first published in 2006 examines the earth's climate systems in light of this incredible growth in data availability data retrieval systems and satellite and computer applications It considers regional climate anomalies developments in teleconnections unusual sequences of recent climate change and human impacts upon the climate system The physical climate forms the main part of the book but it also considers social and economic aspects of the global climate system This textbook has been derived from the authors extensive experience of teaching climatology and atmospheric science Each chapter contains an essay by a specialist in the field to enhance the understanding of selected topics An extensive bibliography is included and lists of websites for further study This textbook will be invaluable to advanced students of climatology and atmospheric science **Long-Term Changes in the Earth's Climate** Joseph J. Smulsky, 2021-07-30

Relatively small climate fluctuations such as the warming period that was observed in recent decades occur over periods of tens and hundreds of years and are called near term climate fluctuations More significant climate changes occur over periods of tens of thousands of years and they are called long term climate changes As a result of the interaction of the Earth with the Moon the Sun and the planets the orbital and rotational movements of the Earth are evolving The orbit itself rotates counter clockwise in its plane making a complete revolution in 147 thousand years and its axis makes one revolution in 68 7 thousand years around a certain direction The axis of rotation of the Earth also rotates clockwise in 25 7 thousand years around another direction In addition these axes also exercise oscillatory movements As a result of the evolution of these movements the insolation of the Earth and consequently the Earth's climate undergo changes These long term changes in the Earth's insolation are analyzed in the astronomical theory of climate change first proposed by M Milankovich almost one hundred years ago This book presents a new version of this theory In contrast to the previous version the problems concerning the evolution of the orbital and rotational movements of the Earth are solved here in a different way with new results obtained These new results coincide with observations and with the warming and cooling periods that took place in the Earth's history This book is intended for a wide range of readers of different specialties and

ages It can be used by both undergraduate students and graduate students in preparation of their term papers and dissertations

Earth's Climate Evolution C. P. Summerhayes, 2015-07-13 To understand climate change today we first need to know how Earth's climate changed over the past 450 million years Finding answers depends upon contributions from a wide range of sciences not just the rock record uncovered by geologists In Earth's Climate Evolution Colin Summerhayes analyzes reports and records of past climate change dating back to the late 18th century to uncover key patterns in the climate system The book will transform debate and set the agenda for the next generation of thought about future climate change The book takes a unique approach to the subject providing a description of the greenhouse and icehouse worlds of the past 450 million years since land plants emerged ignoring major earlier glaciations like that of Snowball Earth which occurred around 600 million years ago in a world free of land plants It describes the evolution of thinking in palaeoclimatology and introduces the main players in the field and how their ideas were received and in many cases subsequently modified It records the arguments and discussions about the merits of different ideas along the way It also includes several notes made from the author's own personal involvement in palaeoclimatological and palaeoceanographic studies and from his experience of working alongside several of the major players in these fields in recent years This book will be an invaluable reference for both undergraduate and postgraduate students taking courses in related fields and will also be of interest to historians of science and or geology climatology and oceanography It should also be of interest to the wider scientific and engineering community high school science students policy makers and environmental NGOs
