Climatic Changes:

Climate Changes during the Holocene and their Impact on Hydrological Systems Arie S. Issar, 2004-08-05 It is now widely accepted that increasing concentrations of greenhouse gases in the atmosphere are causing higher global atmospheric temperatures. However, there is still a great deal of uncertainty about the likely effects of such a temperature rise on climate and even more about the impacts of climate change and variability on the world's hydrological regimes and socio-economic systems. Studying the effects of climate variability in the past can give clues as to possible future effects. This volume provides a comprehensive review of the effects of climate variability on hydrological and human systems in the Holocene, the last 10,000 years, in various parts of the world. The book concentrates on the regions bordering the Mediterranean Sea, western and central Europe, China, Japan, West and South Africa, and the southwestern USA. This book will be of value to researchers and professionals in hydrology, climatology, geology, and historical geography.

Budyko, 1977. Published by the American Geophysical Union as part of the Special Publications Series. At the beginning of the 1960s the opinion was voiced that noticeable world wide changes could take place in the climate in the very near future due to increased industrialization and energy production. Since such changes would have a significant bearing on all fields of human endeavor the task of utilizing this forecast in economic planning became urgent. Shortly afterwards research on anthropogenic climatic variations commenced in several countries and the results were regularly discussed at national and

international scientific meetings These studies confirmed the pressing need for developing methods to predict future climatic variations caused by man s economic activity
