Current Topics in Structural Geology P. L. Hancock, 2013-08-29 *Current Topics in Structural Geology* is a collection of invited papers on particular topics of interest in structural geology from field based problems on the scale of terranes to microstructures in nature and experiment Contributors also explore earthquake faulting S C mylonites tectonics and hydrogeology of accretionary prisms deformation mechanisms transparent polycrystals shape and lattice preferred orientations and mushroom shaped diapirs This text is comprised of 13 chapters the first of which introduces the reader to shallow crustal earthquakes and the structural geology of fault zones The first chapter also emphasizes the seismogenic regime strike slip earthquake rupture processes structural questions posed by seismology and mesothermal gold quartz lodes hosted in steeply inclined shear zones of mixed brittle ductile character Discussion then turns to normal faulting in the upper continental crust along with the application of a method based primarily on fault slip data analysis to determine paleostress in terms of orientation and magnitude The mechanical behavior and deformation textures of simulated halite shear zones are considered with special regard to the internal structures of S C mylonites and their mechanical implications The remaining chapters examine the role of decollement zone in the tectonics and hydrogeology of accretionary prisms synkinematic microscopy of transparent polycrystals and the origin of metamorphic core complexes and detachment faults formed during Tertiary continental extension in the northern Colorado River region This book is intended primarily for students and practitioners of structural geology

Critical Reappraisal Albert J. Warner, Thomas M. Bown, 2025-02-10 The Heart Mountain Detachment Fault HMDF is an

immense geologic structure in northwest Wyoming that as defined prior to this study extends from just inside the northeast entrance of Yellowstone National Park to areas southwest and northeast of Cody WY This enigmatic structure has puzzled geologists for more than 100 years The consensus is that a massive slab of limestones and dolomites 320 485 million years old broke away from an outcrop near Silver Gate MT about 49 million years ago and slid nearly 75 miles to the southeast at speeds of nearly 100 mph to more than 700 mph and broke up into several giant blocks up to five miles in diameter Heart Mountain north of Cody WY the namesake for this displacement is where some of its geologic relationships were first recognized over 125 years ago Our research demonstrates that all of the geologic features attributed to the single event HMDF are instead the result of two geologic events separated in time by more than 47 million years The first we term the Shoshone Sunlight Abiathar Detachment Fault SSADF that occurred 49.5 million years ago and the second we call the Heart Mountain McCullough Peaks Sturzstrom HMMPS that occurred 2.08 million years ago A sturzstrom is a huge landslide that travels a great horizontal distance Both massive displacements were instigated by violent tectonic processes The SSADF was triggered by a powerful megathrust earthquake initiated by plate tectonic movements and followed by extensive volcanism whereas the HMMPS was caused by a gigantic super eruption of a volcano in what is present day Yellowstone National Park
