Reussner, 2008-10-07 Models are used in all kinds of engineering disciplines to abstract from the various details of the modelled entity in order to focus on a specific aspect Like a blueprint in civil engineering a software architecture provides an abstraction from the full

software system's complexity. It allows software designers to get an overview on the system under development and to analyze its properties. In this sense, models are the foundation needed for software development to become a true engineering discipline. Especially when reasoning on a software system's extra-functional properties, its software architecture carries the necessary information for early design-time analyses. These analyses take the software architecture as input and can be used to direct the design process by allowing a systematic evaluation of different design alternatives. For example, they can be used to cancel out decisions which would lead to architecture signs whose implementation would not comply with extra-functional requirements like performance or reliability constraints. Besides such quality attributes directly visible to the end user, internal quality attributes e.g. maintainability also highly depend on the system's architecture. In addition to the above-mentioned technical aspects of software architecture, many non-technical aspects, especially project management related activities, require an explicit software architecture model. The models are used as input for cost estimations, time deadline and resource planning for the development teams. They serve the project management activities of planning, executing and controlling, which are necessary to deliver high quality software systems in time and within the budget.
