Fore perpendicular: It is the vertical line passing through the point of intersection of the summer load line with forward side of the stem.

Aft perpendicular: It is the line perpendicular to the waterplane and passing through the centerline of the rudder pintles.

Length between perpendiculars (lbp): The distance measured along the summer load water plane from fore to aft perpendicular is known as *length between perpendiculars*.

Length overall (loa): It is the distance measured parallel to the summer load waterline between the extreme points at the forward and the aft. The extreme point at the forward can be taken on the bulbous bow.

Length on the waterline (lwl): It is the distance measured between the intersections points of the bow and the after end with the summer load waterline. In case it is not mentioned, the length of the summer load waterline is taken into consideration as the length of the waterline.

Midship or amid ship : The midpoint between the aft and the forward perpendicular is known as midship or amid ship. The section passing through this point and which is normal to the waterplane is called *midship section*. The term 'beam' is quoted at amid ship. The *breadth extreme* is measured at amid ship.
