**Signature verification based on a feature extraction technique** Saba Mushtaq,2017-10-05 Master s Thesis from the year 2012 in the subject Technology grade 10 language English abstract In this research we evaluate the use of GLRLM features in offline handwritten signature verification For each known writer we take a sample of fifteen genuine signatures and extract their GLRLM descriptors We also used some forged signatures to test the efficiency of our system We calculate the simple statistical measures and also inter and intra class Euclidean distances measure of variability within the same author among GLRLM descriptors of the known signatures The key points Euclidean distances the image distances and the intra class thresholds are stored as templates We evaluate use of various intra class distance thresholds like the mean standard deviation and range For each signature claimed to be of the known writers we extract its GLRLM descriptors and calculate the inter class distances that is the Euclidean distances between each of its GLRLM descriptors and those of the known template and image distances between the test signature and members of the genuine sample The intra class threshold is compared to the inter class threshold for the claimed signature to be considered a forgery A database of 525 genuine signatures and 30 forged signatures consisting of a training set and a test set are used

*Multibiometric Systems* Karthik Nandakumar,2008 Multibiometric systems are gaining popularity because they are able to overcome limitations such as non universality noisy sensor data and susceptibility to spoof attacks common in unibiometric systems We address two critical issues in the design of a multibiometric system namely fusion methodology and template security We propose a fusion methodology based on the Neyman Pearson theorem for combination of match scores provided by multiple biometric matchers The likelihood ratio LR test used in the Neyman Pearson theorem directly maximizes the genuine accept rate GAR at any desired false accept rate FAR We extend the likelihood ratio based fusion scheme to incorporate the quality of the biometric samples The LR framework can be used for designing sequential multibiometric systems by constructing a binary decision tree classifier based on the marginal likelihood ratios of the individual matchers The use of image quality information further improves the GAR to 90% at a FAR of 0.001% Next we show that the proposed likelihood ratio based fusion framework is also applicable to a multibiometric system operating in the identification mode We investigate rank level fusion strategies and propose a hybrid scheme that utilizes both ranks and scores to perform fusion in the identification scenario Fusion of multiple biometric sources requires storage of multiple templates for the same user corresponding to the individual biometric sources Template security is an important issue because stolen biometric templates cannot be revoked We propose a scheme for securing multibiometric templates as a single entity using the fuzzy vault framework We have developed fully automatic implementations of a fingerprint based fuzzy vault that secures minutiae templates and an iris cryptosystem that secures iris code templates We also demonstrate that a multibiometric vault achieves better recognition performance and higher security compared to a unibiometric vault
