In the most developed branches of crystallography, structure solution proceeds by two distinct steps: first, an approximate model of the structure is deduced *directly* from the measured data by an algorithm which assumes no preconceived model; second, a process of structure refinement simulates the experimental data for systematic variations of the parameters of such a model and determines a final structure to be that which agrees best with the data. The developments of direct methods for surface crystallography are aimed at enabling the first of these steps to be performed by an objective algorithm applied directly to the experimental data, in order to avoid the (fallible) human guesswork that has been largely applied up to the present to postulate structural models for subsequent refinement.

1. Introduction

Crystallography is the science of the determination of the atomic-scale structure of repeat units (or *unit cells*) of a crystal from the distribution of the scattering of radiation incident on it. If we restrict our attention initially to the far-field measurement of weak scattering (or single scattering) of an incident plane wave (as is usually the case with x-ray

scattering), the complex amplitudes of the scattered radiation may be regarded as a set of Fourier coefficients of the distribution of scattering matter within each unit cell. If these complex amplitudes may be measured, the recovery of the structure of the unit cell would simply require performing an inverse Fourier transform of those amplitudes. Unfortunately, usual crystallographic experiments measure not these complex amplitudes, but rather their square moduli in the form of diffracted *intensities*. The square roots of these measured intensities are proportional to the (real) amplitudes of the scattered radiation, but the corresponding *phases* are not measured directly.

A major challenge of crystallography is the determination of these phases. In the crystallography of bulk samples, there are two main classes of techniques: those which require information extraneous to the intensities from the diffraction of radiation of a single wavelength, and those which require no further information. In the former class fall three techniques commonly used in protein crystallography, namely multiple isomorphous replacement (MIR) (Green *et al* 1954, Blow and Crick 1959) which requires extra experimental data from related compounds with heavy-atom substitutions; multi-wavelength anomalous dispersion (MAD) (Hendrickson 1991, Leahy *et al* 1992) which requires extra diffraction data from x-rays of wavelengths close to absorption edges of atoms of the sample; and the technique of molecular replacement (Rossman and Blow 1962) which requires a knowledge of the structure

Fortier, 2013-06-29 This book of the proceedings of the 1997 NATO Advanced Study Institute ASI on Direct Methods for Solving Macromolecular Structures was assembled from the lecturers contributions and represents a comprehensive and in depth overview of crystallographic structure determination methods for macromolecules While having a focus based on the direct methods the Institute adopted an inclusive and broad perspective Thus both direct and experimental phasing techniques are presented in this book highlighting their complementarities and synergies As well methodologies spanning the full crystallographic image reconstruction process from low resolution envelope definition to high resolution atomic refinement are discussed The first part of the book introduces the array of tools currently used in structure determination whether originating from a mathematical computational or experimental framework This section of the book displays the variety and ingenuity of old and new phasing approaches developed to solve increasingly complex structures Some of the contributions focus on recent developments and or implementations that have given older approaches a new life A case in point is the re implementation of Buerger s superposition approach which is now solving protein structures Another beautiful example is found in the introduction to the traditional multiple isomorphous replacement approach where new techniques such as site directed mutagenesis and the use of inert gases in the preparation of heavy atom derivatives are described Equally impressive are the presentations of newer approaches which take advantage of advances on the experimental front e g

Theory and Practice of Direct Methods in Crystallography M. F. C. Ladd, R. A. Palmer, 2012-12-06 Direct methods of crystal structure determination are usually associated with techniques in which phases for a set of structure factors are determined from the corresponding experimental amplitudes by probabilistic calculations It is thus implied that such ab initio phase calculations do not require a knowledge of atomic positions and this basis distinguishes direct methods from other techniques for structure determination An acceptably wider interpretation of the term direct methods leads to other important applications involving inter alia the use of heavy atoms resolution limited phase data for large molecules rotation functions and Fourier series These topics are discussed in the later chapters of this book Although some earlier theoretical investigations were made by Harker and Kaspar direct methods may be considered to have begun around the year 1950 Important landmarks in the development of the subject include the book by Hauptmann and Karle The Centrosymmetric Crystal 1953 the definitive paper by Karle and Karle in Acta Crystallographica 1966 and the recent 1978 sophisticated program package MULTAN 78 produced mainly by Germain Main and Woolfson Woolfson s book Direct Methods in Crystallography was published in 1961 but because of the rapid progress in direct methods much of it soon became outmoded It is interesting to note that direct methods nearly came into being many years earlier Certainly the E2 relationship was used implicitly by Lonsdale in 1928 in determining the crystal structure of hexamethylbenzene An

Graphical and Tabular Methods in Crystallography Thomas Vipond Barker, 1922 **Physical and Direct Methods in Crystallography** Adam Charles Ralph, 1991 **Direct Methods in Crystallography**, 1980 [Methods and Instrumentations: Results and Recent Developments](#) Arnold S. Marfunin, 1995-02-20 All existing introductory reviews of mineralogy are written according to the same algorithm sometimes called the Dana System of Mineralogy Even modern advanced handbooks which are certainly necessary include basic data on minerals and are essentially descriptive When basic information on the chemistry structure optical and physical properties

distinguished features and paragenesis of 200-400 minerals is presented then there is practically no further space available to include new ideas and concepts based on recent mineral studies. A possible solution to this dilemma would be to present a book beginning where introductory textbooks end for those already familiar with the elementary concepts. Such a volume would be tailored to specialists in all fields of science and industry interested in the most recent results in mineralogy. This approach may be called Advanced Mineralogy. Here an attempt has been made to survey the current possibilities and aims in mineral matter investigations including the main characteristics of all the methods, the most important problems and topics of mineralogy and related studies. The individual volumes are composed of short condensed chapters. Each chapter presents in a complete albeit condensed form specific problems, methods, theories and directions of investigations and estimates their importance and strategic position in science and industry.

Advanced Mineralogy: Methods and Instrumentations
Arnol'd Sergeevich Marfunin, 1994. This reference book is the third in a series of five volumes presenting a concise treatise on problems and final results of modern studies of earth and planetary materials in their most sophisticated aspects. It is encyclopedic in its coverage of subjects which include the systematic description of all areas of mineral matter studies corresponding to the actual capabilities and needs of science and industry. This third volume with contributions from 200 top specialists from all over the world contains chapters on Mineral Matter in Space, Mineralogy of the Mantle and Core, Mineralogy of the Ocean Floor, Biomineralization, Environmental Mineralogy, Radiation Mineralogy and Gemology and Jewelry.
