Economic development has long been acknowledged for its beneficial effects on human well being. In the context of economic globalization and vertical specialization, increasing the quality of export products is more critical and necessary to export success and sustainable development. The product's quality is inextricably linked to its manufacture and production, which need various types of energy and raw materials. Meanwhile, the adoption of more environmentally friendly and cleaner energy sources contributes to the achievement of sustainable production. Therefore, product quality may provide a new perspective from which to investigate the systematic relationship between greener and renewable energy sources, sustainable production, and environmental regulations, as well as the nature of export competitiveness. Generally, export product quality has referred to the quality of manufactured products within the product lines. Quality refers to the relative price of a country's varieties within their respective product lines. Product sophistication assesses the composition of the aggregate exports. Different varieties of the same product at the same quality level are being produced by several developing and emerging economies. Within any given product line, quality converges both conditionally and unconditionally to the world's benchmark. Increases in institutional quality and human capital are associated with faster quality upgrading. In turn, faster growth in quality is associated with more rapid output growth. The existing literature has mostly concentrated on the question of whether environmental regulation enhances or erodes export competitiveness, offering some valuable insights into Porter's theory but it lacks a coherent theoretical framework. Little research has been done to examine the relationship between export product quality and renewable energy sources, manufacturing, and overall sustainable production, calling for advancement of the scholarship to tackle this burning issue. Numerous concerns have been expressed over the appalling connection between sustained development, industry, and environmental protection. The United Nations (UN) adopted the 2030 Agenda for Sustainable Development in 2015 to balance economic, social, and environmental development through the introduction of 17 Sustainable Development Goals (SDG), which encouraged researchers in trade, environment, energy, and related fields to adopt an integrative rather than isolative approach. This Research Topic is dedicated to the study of the environment through the lenses of export product quality, export policies, and sustainable production. The aim is to advance knowledge in the fields of export quality, trade perspectives, renewable energy, the environment, and sustainable production through the dissemination of research that promotes holistic sustainability for the greater welfare of humanity. This topic will prioritize research focusing on emerging and developing economies. Academic scholars and researchers must both test hypotheses and put forward ideas for new solutions. For example, it is assumed that higher quality products require expensive inputs and resources for manufacturing. It must also provide strategies for a speedy and economically viable transition to renewable energy. This Research Topic is a step in this
