From developmental neurology to brain health across the lifespan: Innovation in training, care, and public policy

EDITOR—Vollmer highlights that developmental neurology is essential for the understanding of the continuum and dynamics of brain development and brain diseases, from the fetal and neonatal period to adolescence. Also, that it is a prerequisite for the smooth care transition between different age groups.¹ Therefore, developmental neurology should be substantially embedded in curricula and portfolios of paediatric neurology and neonatology training programs, an effort which strongly relies on multiprofessional collaborations.

It is estimated that one-third of the global population will develop a neurological disorder during their lifetime, while 1 billion individuals worldwide currently have a mental health disorder.² Brain Innovation Days took place in Brussels in October 2023 with a focus on resilience, better brain health, and adaptation to an evolving environment in 'polycrisis': geopolitical conflicts, climate crisis, pandemic, social tension, and economic slowdown (<https://www.braininnovationdays.eu/the-brain-in-the-21st-century/>). This is in accordance with the World Health Organization intersectoral global action plan (IGAP) on epilepsy and other neurological disorders (2022–2031) which is looking at improving care, recovery, well-being, and participation of individuals living with neurological disorders across the life course, while reducing associated mortality, morbidity, and disability.³

The roots of brain diseases can lie in early childhood and brain health as a condition starts even before pregnancy. From this point of view, the integration of basic concepts of developmental neurology into national health plans and international health initiatives can make a meaningful impact on the landscape of brain health. According to the American Academy of Neurology, the four pillars of brain health are science, public policy, care, and public education.⁴ Could those pillars become essential components of the training of next generation child neurologists?

It is a continuing question whether child neurologists have a deep understanding of neuroscience principles, as exposure to basic science is not included in traditional national training programs. Nevertheless, in view of the emerging breakthroughs in the field of genetics, novel treatments are available for an increasing number of neurological conditions (rare and complex epilepsies, neuromuscular disorders) and clinicians are those who inform patients and families of mechanism of action, benefits, perspectives,

limitations, and risks, while they also handle and rationalize expectations.⁵ However, bringing child neurologists to the lab and showing how research is done needs appropriate funding: the European Paediatric Neurology Society already funds fellowships for junior child neurologists across Europe on a yearly basis and similar programs could be used to enhance exposure to basic science for next generation clinicians. In parallel, this would promote collaborations and networking and facilitate the exchange of knowledge and the generation of large-scale data.

High-quality data is also essential to influence policy makers and drive changes. From creating migraine-friendly workplaces to prescribing museum visits for people with mental health problems, innovative ideas on care delivery can promote inclusion of people with brain conditions in society, embed brain health in awareness-raising activities, and present a positive approach to brain conditions. At the same time, Brain Health Mission prioritizes effective prevention, early detection, and early intervention strategies, but the efficacy of this vision requires appropriate patient education and commitment to promoting healthy habits that support brain and mental health, including adequate sleep, regular exercise, nutritious eating, and social engagement.^{2, 3} But are child neurologists confident and qualified to advocate for policy changes and educate patients to advocate for their brain health? Although advocacy is recognized as a professional responsibility, there is little evidence that most training programs teach advocacy skills. Incorporation of health diplomacy and advocacy curricula into training programs can boost clinicians' skills for driving large-scale changes.⁶ Since 2022, the Young EPNS Committee has introduced a working group for climate crisis and health inequalities. This is one of the initiatives expected to enrich the subspecialty of child neurology with social health determinants.
