## **Advances In Database Systems:**

Advanced Database Systems Nabil R. Adam, Bharat K. Bhargava, 1993-12-08 Database management is attracting wide interest in both academic and industrial contexts New application areas such as CAD CAM geographic information systems and multimedia are emerging The needs of these application areas are far more complex than those of conventional business applications The purpose of this book is to bring together a set of current research issues that addresses a broad spectrum of topics related to database systems and applications The book is divided into four parts object oriented databases temporal historical database systems query processing in database systems heterogeneity interoperability open system architectures multimedia database systems

Advanced Database Systems Carlo Zaniolo, 1997-05 The database field has experienced a rapid and incessant growth since the development of relational databases The progress in database systems and applications has produced a diverse landscape of specialized technology areas that have often become the exclusive domain of research specialists Examples include active databases temporal databases object oriented databases deductive databases imprecise reasoning and queries and multimedia information systems This book provides a systematic introduction to and an in depth treatment of these advanced database areas It supplies practitioners and researchers with authoritative coverage of recent technological advances that are shaping the future of commercial database systems and intelligent information systems Advanced Database Systems was written by a team of six leading specialists who have made significant contributions to the development of the technology areas covered in the book Benefiting from the authors long experience teaching graduate and professional courses this book is designed to provide a gradual introduction to advanced research topics and includes many examples and exercises to support its use for individual study desk reference and graduate classroom teaching

**Advances in Database Systems** J. Paredaens, L. Tenenbaum, 2014-05-04 Advanced information technology is pervasive in any kind of human activity science business finance management and others and this is particularly true for database systems Both database theory and database applications constitute a very important part of the state of the art of computer science Meanwhile there is some discrepancy between different aspects of database activity Theoreticians are sometimes not much aware of the real needs of business and industry software specialists not always have the time or the opportunity to get acquainted with the most recent theoretical ideas and trends as well as with advanced prototypes arising from these ideas potential users often do not have the possibility of evaluating the theoretical foundations and the potential practical impact of different commercial products So the main goal of the course was to put together people involved in different aspects of database activity and to promote active exchange of ideas among them

*Advances in Object-Oriented Database Systems* Asuman Dogac, M. Tamer Özsu, Alexandros Biliris, Timos Sellis, 2013-11-09 Object oriented database management systems OODBMSs have generated significant excitement in the database community in the last decade This interest stems from a real need for data management support for what are called advanced application areas that are not well served by relational technology The case for object oriented technology has been made on three fronts First is the data modeling requirements of the new applications Some of the more important shortcomings of the relational systems in meeting the requirements of these applications include 1 Relational systems deal with a single object type a relation A relation is used to model different real world objects but the semantics of this association is not part of the database Furthermore the attributes of a relation may come only from simple and fixed data type domains numeric character and sometimes date types Advanced applications require explicit storage and manipulation of more abstract types e g images design documents and the ability for the users to define their own application specific types Therefore a rich type system supporting user defined abstract types is required 2 The relational model structures data in a relatively simple and flat manner Non traditional applications require more complex object structures with nested objects e g a vehicle object containing an engine object

**Advances in Intelligent Information and Database Systems** Ngoc Thanh Nguyen, Radoslaw Katarzyniak, 2010-04-09 Intelligent information and database systems are two closely related and we established subfields of modern computer science They focus on the integration of artificial intelligence and classic database technologies in order to create the class of next generation information systems The major target of this new generation of systems is to provide end users with intelligent behavior simple and or advanced learning problem solving uncertain and certain reasoning self organization cooperation etc Such intelligent abilities are implemented in classic information systems to make them autonomous and user oriented in particular when advanced problems of multimedia information and knowledge discovery access retrieval and manipulation are to be solved in the context of large distributed and heterogeneous environments It means that intelligent knowledge based information and database systems are used to solve basic problems of large collections management carry out knowledge discovery from large

data collections reason about information under uncertain conditions support users in their for lation of complex queries etc Topics discussed in this volume include but are not limited to the foundations and principles of data information and knowledge models methodologies for intelligent information and database systems analysis design implementation validation maintenance and evolution
