Cellular Processes And Brain Potentials:

Cellular Processes and Brain Potentials Richard F. Thompson, Michael M. Patterson, 1973 **Bioelectric Recording Techniques** Richard F. Thompson, Michael M. Patterson, 1974 **Bioelectric Recording Techniques** Richard F. Thompson, Michael M. Patterson, 1973 **Neuroanatomical Research Techniques** Richard T. Robertson, 2013-10-22

Neuroanatomical Research Techniques discusses developments in major neuroanatomical research techniques. The book is organized into four parts. Part I deals generally with the preparation and study of brain tissue. It includes a chapter on the microscope discussing optical magnification limitations of microscopy and optical contrasting methods. Other chapters summarize basic techniques for tissue preparation and sectioning, present guidelines for a number of standard but essential staining procedures, and present sophisticated and contemporary computer techniques that are proving to be invaluable as neuroanatomy evolves from a qualitative to a quantitative discipline. Part II deals with techniques often used for the study of normal tissue. These include the Golgi method, fluorescence histochemistry techniques for staining single neurons, and the use of the electron microscope. Part III presents techniques for studying intrinsic connections of the nervous system. These include techniques for silver impregnation of degenerating fibers, autoradiographic technique for studying axonal projections, and somatopetal movement of horseradish peroxidase as a tool for studying connections and neuron morphology. Part IV discusses the interpretation of results from neuroanatomical research techniques and presents examples of the applications of neuroanatomical methods to major problems in physiological psychology.

Nothing tends so much to the advancement of knowledge as the application of a new instrument. Sir Humphry Davy 1778-1829. Neuroscience has become a rapidly expanding endeavor that relies on a number of other sciences such as mathematics, physics, chemistry, engineering, computer science, general biology, and medicine, genetics, etc. In fact, many of its recent successes result from the application of ideas and methods borrowed from these fields. Insofar as it is a true interdisciplinary undertaking, this convergence of influences accounts for part of its enormous attractiveness and fascination to students and researchers from diverse walks of life or science. For that matter, it is probably fair to say that a great number of neuroscience's most creative and productive proponents have been lured into this field not only by the excitement about the possibility to unmask the secrets of the human mind, but also by the appeal of a vast unknown land needing cultivation and tools to cultivate it. Danger may arise for any science if it is dominated by methods and techniques of investigation rather than by problems to be solved and concepts to be developed. This might concentrate efforts onto the technically feasible and doable rather than on the real issues. But on the other hand, especially the young and growing sciences are heavily dependent on the development and application of methods, often even before a problem relying on these methods may become apparent.
