

Distributed processing

Due to the complexity of working with big data, often the solution lies within distributed processing networks.

The principle is that you spread large and complex tasks over a number of computers or servers.

Typically one computer will be allocated as the master and will control the others. Each computer is allocated subtasks and messages are then passed between computers in order to meet the overall

Open Distributed Processing and Distributed Platforms Jerome Rolia, Jacob Slonim, John Botsford,2016-01-09 Advances in computer networking have allowed computer systems across the world to be interconnected Open Distributed Processing ODP systems are those that support heterogenous distributed applications both within and between autonomous organizations Many challenges must be overcome before ODP systems can be fully realized This book describes the recent advances in the theory and practice of developing deploying and managing open distributed systems Applications of these systems include but are not limited to telecommunication medical and large scale transaction processing and electronic commerce systems All of these are currently developed on distributed platforms For anybody working in industry or research in this field Open Distributed Processing and Distributed Platforms will prove an invaluable text *Open Distributed Processing* K. Raymond, L. Bray,1982 Practical Distributed Processing Phillip J. Brooke, Richard F. Paige,2007-09-05 Distributed processing has a strong theoretical foundation but many day to day practitioners make limited use of the advantages this theory can give them The result includes unreliable systems with obscure and intermittent failures that can cost time money and in extreme cases lives Reliable construction of distributed and concurrent systems must incorporate theory in practice This book provides a concise presentation of the theory closely linked to the practical realization of these concepts This highly practical presentation contains all the elements needed for a

Formal Methods for Distributed Processing Howard Bowman,John Derrick,2001-10-22 Originally published in 2002 this book presents techniques in the application of formal methods to object based distributed systems A major theme of the book is how to formally handle the requirements arising from OO distributed systems such as dynamic reconfiguration encapsulation subtyping inheritance and real time aspects These may be supported either by enhancing existing notations such as UML LOTOS SDL and Z or by defining fresh notations such as Actors Pi calculus and Ambients The major specification notations and modelling techniques are introduced and compared by leading researchers The book also includes a description of approaches to the specification of non functional requirements and a discussion of security issues Researchers and practitioners in software design object oriented computing distributed systems and telecommunications systems will gain an appreciation of the relationships between the major areas of concerns and learn how the use of object oriented based formal methods provides workable solutions

Tutorial, a Pragmatic View of Distributed Processing Systems Kenneth J. Thurber,1980 The concepts described here were originally developed during a series of seminars given at the University of Minnesota portions of which dealt with the meaning of distributed processing and introduced overall concepts in distributed systems This volume presents those ideas beginning with the overall concept and works toward implemented hardware structures The intent of this volume is to illustrate the problems and promises of distributed systems while informing readers of the pitfalls and progress of distributed systems

Distributed and Parallel Computing Michael Hobbs,Andrzej Goscinski,Wanlei Zhou,2005-10-13 There are many applications that require parallel and distributed processing to allow complicated engineering business and research problems to be solved in a reasonable time Parallel and distributed processing is able to improve company profit lower costs of design production and deployment of new technologies and create better business environments The major lesson learned by car and aircraft engineers drug manufacturers genome researchers and other specialist is that a computer system is a very powerful tool that is able to help them solving even more complicated problems That has led computing specialists to new computer system architecture and exploiting parallel computers clusters of clusters and distributed systems in the form of grids There are also institutions that do not have so complicated problems but would like to improve profit lower costs of design and production by using parallel and distributed processing on clusters In general to achieve these goals parallel and distributed processing must become the computing mainstream This implies a need for new architectures of parallel and distributed systems new system management facilities and new application algorithms This also implies a need for better understanding of grids and clusters and in particular their operating systems scheduling algorithms load balancing heterogeneity transparency application deployment which is of the most critical importance for their development and taking them by industry and business
