Lecture 1: How nature handles complexity: self-organization of behavior

Introduction

Top-down (directed) vs bottom-up (self-organized) organization. For example clapping at the pace of an instructor or without instructor.

Science of emergence deals with the spontaneous pattern formation.

Large scale order out of small-scale interactions. The large scale is what you see, so the flog of birds flying in a pattern.

The behavior of the whole is more than (and different from) the sum of the parts, due to nonlinear interactions among the parts or between the parts and the environment.

Clapping is about synchrony and volume. If you clap in synchrony the volume is loud, but at the cost of silence between the claps. The sound levels are higher in unsynchronized clapping, because there is no periods of silence between the claps. You cannot clap fast and in synchrony.

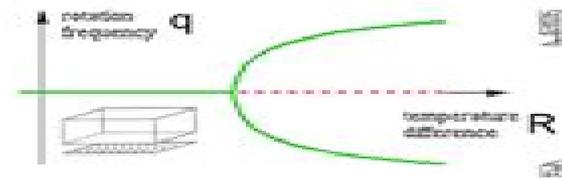

Smaller destination in clapping frequency is the low enthusiasm situation. Much higher SD in frequencies in the enthusiastic situation. This is according to Nada why you cannot clap fast and in synchrony, because the large SD between subjects.

Synergies

Synergetics: Science of self-organization of systems consisting of many interacting subsystems

- Is a rigorous, operationally defined approach that focuses on spontaneous pattern formation.
- Is a nomothetic approach (i.e., single law for many different systems)
- Exploit formal analogies (i.e. empirical equivalents).

Rayleigh-Benard convection: Complex systems consisting of many interacting subsystems. Like when boiling soup. The temperature gradient R is the unspecific control parameter. It does not tell every individual molecule what to do, but it effects the overall system. At a specific value of R the soup transitions from the state of rest to a rotating state, either clock-wise or counter clock-wise (pitchfork bifurcation diagram, see graph). Clusters are formed with molecules doing the same thing. After a while all the molecules act as a whole.

Circular causality: Order parameter (the state of a system as a whole) emerges from interactions among the parts, but the order parameter in turn simultaneously enslaves the behavior of the parts (it is hard to do something other than what the whole is doing, if everybody is clapping it is easy to clap along, but to initiate the clapping is difficult). Example with the bridge: because people are walking in a similar stepping pattern, the bridge starts to sway a bit. With this swaying you are prone to walk in this stepping pattern, resulting in more sway of the bridge.

Coordination Dynamics: Issues and Trends Viktor K. Jirsa, Scott Kelso, 2013-11-01 This book brings together scientists from all over the world who have defined and developed the field of Coordination Dynamics Grounded in the concepts of self organization and the tools of nonlinear dynamics appropriately extended to handle informational aspects of living things Coordination Dynamics aims to understand the coordinated functioning of a variety of different systems at multiple levels of description The book addresses the themes of Coordination Dynamics and Dynamic Patterns in the context of the following topics Coordination of Brain and Behavior Perception Action Coupling Control Posture Learning Intention Attention and Cognition

Coordination: Neural, Behavioral and Social Dynamics Armin Fuchs, Viktor K. Jirsa, 2007-12-11 One of the most striking features of Coordination Dynamics is its interdisciplinary character The problems we are trying to solve in this field range from behavioral phenomena of interlimb coordination and coordination between stimuli and movements perception action tasks through neural activation patterns that can be observed during these tasks to clinical applications and social behavior It is not surprising that close collaboration among scientists from different fields as psychology kinesiology neurology and even physics are imperative to deal with the enormous difficulties we are facing when we try to understand a system as complex as the human brain The chapters in this volume are not simply write ups of the lectures given by the experts at the meeting but are written in a way that they give sufficient introductory information to be comprehensible and useful for all interested scientists and students

Dynamic Patterns J. A. Scott Kelso, 1995 foreword by Hermann Haken For the past twenty years Scott Kelso s research has focused on extending the physical concepts of self organization and the mathematical tools of nonlinear dynamics to understand how human beings and human brains perceive intend learn control and coordinate complex behaviors In this book Kelso proposes a new general framework within which to connect brain mind and behavior Kelso s prescription for mental life breaks dramatically with the classical computational approach that is still the operative framework for many newer psychological and neurophysiological studies His core thesis is that the creation and evolution of patterned behavior at all levels from neurons to mind is governed by the generic processes of self organization Both human brain and behavior are shown to exhibit features of pattern forming dynamical systems including multistability abrupt phase transitions crises and intermittency Dynamic Patterns brings together different aspects of this approach to the study of human behavior using simple experimental examples and illustrations to convey essential concepts strategies and methods with a minimum of mathematics Kelso begins with a general account of dynamic pattern formation He then takes up behavior focusing initially on identifying pattern forming instabilities in human sensorimotor coordination Moving back and forth between theory and experiment he establishes the notion that the same pattern forming mechanisms apply regardless of the component parts involved parts of the body parts of
