### Abstract

During neural communication by means of action potentials, small electromagnetic (EM) fields are also generated. We use a three layered cortical neural network model to study the effects of EM fields and gap junctions on the spatio-temporal network activity. We investigate the possible role of these effects in synchronizing activity, a phenomenon which has been observed in the olfactory cortex and hippocampus. The simulation results support the notion that fast synchronization of activity in distant parts of the neural network are made possible by means of EM fields and/or gap junctions. © 2000 Elsevier Science B.V. ### 1. Introduction

When neurons communicate with each other by means of action potentials, also small electromagnetic (EM) fields are generated. If several cells fire synchronously, these fields can become large enough to induce spikelets in neighboring cells [3,11]. Spikelets are small deviations in the membrane potential (up to 5 mV) with approximately the same duration as an action potential. Another means of non-synaptic (electric) interaction occurs through gap junctions. Here, one spiking cell is enough to induce spikelets in a connected cell [3,9,11]. Both types of spikelets could serve as complementary information carriers, a possibility which traditionally has been neglected in the literature.

There is strong evidence that EM effects could be of significance under certain, often pathological, conditions, but several studies show that even weaker fields than the
