Coordinated Computing:

Coordinated Computing Robert E. Filman, Daniel P. Friedman, 1984 This is one of the first books that attempts to discuss distributed programming It covers a wide spectrum of distributed programming models and makes a relative comparison of various message passing models concurrent languages and distributed programming languages The authors treatment of exchange functions which is not widely available otherwise discusses some of the issues of realtime programming languages After a brief review of computation theory programming languages synchronization mechanisms and primitives of distributed computing the authors discuss seven models for coordinated computing various programming languages and the problems of organizing distributed systems Recommended for those interested in distributed programming or as a second level course on programming languages for graduate students

Social Edge Computing Dong Wang, Daniel 'Yue' Zhang, 2023-06-22 The rise of the Internet of Things IoT and Artificial Intelligence AI leads to the emergence of edge computing systems that push the training and deployment of AI models to the edge of networks for reduced bandwidth cost improved responsiveness and better privacy protection allowing for the ubiquitous AI that can happen anywhere and anytime Motivated by the above trend this book introduces a new computing paradigm the Social Edge Computing SEC that empowers human centric edge intelligent applications by revolutionizing the computing intelligence and the training of the AI models at the edge The SEC paradigm introduces a set of critical human centric challenges such as the rational nature of edge device owners pronounced heterogeneity of the edge devices real time AI at the edge human and AI interaction and the privacy of the edge users The book addresses these challenges by presenting a series of principled models and systems that enable the confluence of the computing capabilities of devices and the domain knowledge of the people while explicitly addressing the unique concerns and constraints from humans Compared to existing books in the field of edge computing the vision of this book is unique we focus on the social edge computing SEC an emerging paradigm at the intersection of edge computing AI and social computing This book discusses the unique vision challenges and applications in SEC To our knowledge keeping humans in the loop of edge intelligence has not been systematically reviewed and studied in an existing book The SEC vision generalizes the current machine to machine

interactions in edge computing e.g mobile edge computing literature and machine to AI interactions e.g edge intelligence literature into a holistic human machine AI ecosystem *Integrated Networking, Caching, and Computing* F. Richard Yu, Tao Huang, Yunjie Liu, 2018-06-13 This book features the major research advances on integrated networking caching and computing Information centric networking based caching is one of the promising techniques for future networks The cloud computing paradigm has been widely adopted to enable convenient on demand network access to a shared pool of configurable computing resources In addition fog edge computing is proposed to deploy computing resources closer to end devices From the perspective of applications network cache and compute are underlying enabling resources How to manage control and optimize these resources can have significant impacts on application performance **High Performance Computing** Thomas Sterling, Maciej Brodowicz, Matthew Anderson, 2024-09-19 Performance Computing Modern Systems and Practices is a fully comprehensive and easily accessible treatment of high performance computing covering fundamental concepts and essential knowledge while also providing key skills training With this book students will begin their careers with an understanding of possible directions for future research and development in HPC domain scientists will learn how to use supercomputers as a key tool in their quest for new knowledge and practicing engineers will discover how supercomputers can employ HPC systems and methods to the design and simulation of innovative products This new edition has been fully updated and has been reorganized and restructured to improve accessibility for undergraduate students while also adding trending content such as machine learning and a new chapter on CUDA Covers enabling technologies system architectures and operating systems parallel programming languages and algorithms scientific visualization correctness and performance debugging tools and methods GPU accelerators and big data problems Provides numerous examples that explore the basics of supercomputing while also providing practical training in the real use of high end computers Helps users with informative and practical examples that build knowledge and skills through incremental steps Features sidebars of background and context to present a live history and culture of this unique field **Cyberspace Mimic Defense** Jiangxing Wu, 2019-12-02 This book discusses uncertain threats which are caused by unknown attacks based on unknown vulnerabilities or backdoors in the information system or control devices and software hardware Generalized robustness control architecture and the mimic defense mechanisms are presented in this book which could change the easy to attack and difficult to defend game in cyberspace The endogenous uncertain effects from the targets of the software hardware based on this architecture can produce magic mimic defense fog and suppress in a normalized mode random disturbances caused by physical or logic elements as well as effects of non probability disturbances brought by uncertain security threats Although progress has been made in the current security defense theories in cyberspace and various types of security technologies have come into being the effectiveness of such theories and technologies often depends on the scale of the prior knowledge of the attackers on the part of the defender and on the acquired real timing and accuracy regarding the attackers

behavior features and other information Hence there lacks an efficient active defense means to deal with uncertain security threats from the unknown Even if the bottom line defense technologies such as encrypted verification are adopted the security of hardware software products cannot be quantitatively designed verified or measured Due to the loose coupling relationship and border defense modes between the defender and the protected target there exist insurmountable theoretical and technological challenges in the protection of the defender and the target against the utilization of internal vulnerabilities or backdoors as well as in dealing with attack scenarios based on backdoor activated collaboration from both inside and outside no matter how augmented or accumulated protective measures are adopted Therefore it is urgent to jump out of the stereotyped thinking based on conventional defense theories and technologies find new theories and methods to effectively reduce the utilization of vulnerabilities and backdoors of the targets without relying on the priori knowledge and feature information and to develop new technological means to offset uncertain threats based on unknown vulnerabilities and backdoors from an innovative perspective This book provides a solution both in theory and engineering implementation to the difficult problem of how to avoid the uncontrollability of product security caused by globalized marketing COTS and non trustworthy software hardware sources It has been proved that this revolutionary enabling technology has endowed software hardware products in IT ICT CPS with endogenous security functions and has overturned the attack theories and methods based on hardware software design defects or resident malicious codes This book is designed for educators theoretical and technological researchers in cyber security and autonomous control and for business technicians who are engaged in the research on developing a new generation of software hardware products by using endogenous security enabling technologies and for other product users Postgraduates in IT ICT CPS ICS will discover that as long as the law of structure determines the nature and architecture determines the security is properly used the problem of software hardware design defects or malicious code embedding will become the swelling of Achilles in the process of informationization and will no longer haunt Pandora s box in cyberspace Security and opening up advanced progressiveness and controllability seem to be contradictory but there can be theoretically and technologically unified solutions to the problem
