

Active Directory planning and design

It's important to know how to [design a plan to implement Active Directory](#). You should always fully document your intended domains, forests, organizational units, sites, DNS infrastructure and security strategies. This documentation becomes the plan for your new infrastructure when you make the migration.

The basics of Active Directory planning

When you are performing an Active Directory migration, you basically have two options: domain upgrading or domain restructuring. *Domain upgrading* is little more than upgrading each existing Windows domain controller to a more current Windows domain controller. The upgrade process starts by upgrading the PDCs in each domain, followed by the BDCs. *Domain restructuring* involves creating an Active Directory network from scratch. In a restructure, you will move systems and reroute connections to comply with a new infrastructure and layout design. Often restructuring will result in fewer but larger domains.

So the question becomes, "[Should you upgrade or restructure?](#)"

Deciding which path to take, or which process to perform first, all depends on your specific situation. But there are a few guidelines that can help you make the choice.

First, if your current domain structure is supporting your work tasks and doesn't seem to involve an inordinate amount of extraneous administration, then upgrading may be preferable. However, if the current domain structure is not adequate and is the primary motivation for the migration, restructuring is likely the way to go. Secondly, if you must support the production environment throughout the migration process, upgrading will retain overall network functionality and therefore is preferable. But if you can afford to lose productivity during the migration, restructuring is better. However, restructuring can be performed on a staggered schedule so no significant loss of productivity is noticed.

Remember that while upgrading will cause the least downtime in terms of getting the domain back into working order, it often is an insufficient migration. Many of the benefits of Windows 2000 and Windows 2003-based Active Directory domains cannot be fully realized without reconfiguring the design of your network. Restructuring will require significant work to implement, but it makes reaping the benefits of Active Directory easier to exploit for your organization.

Developing an Active Directory migration strategy

When taking on an Active Directory migration project, like with all large projects, it's best to have a strategy in place. It is key to create an [Active Directory migration checklist](#), with steps such as collecting diagrams and configuration of the current DNS and network structure (bandwidth, remote locations, stability, etc.), determining the rights, objects and policies that will need to be migrated, and creating fall back procedures in case of failure.
