Kreinovich,2013-04-17 After the pioneering works by Robbins 1944 1945 and Choquet 1955 the notation of a set valued random variable called a random closed set in literatures was systematically introduced by Kendall 1974 and Matheron 1975

It is well known that the theory of set valued random variables is a natural extension of that of general real valued random variables or random vectors. However, owing to the topological structure of the space of closed sets and special features of set theoretic operations of Beer [27], set valued random variables have many special properties. This gives new meanings for the classical probability theory. As a result of the development in this area in the past more than 30 years, the theory of set valued random variables with many applications has become one of the new and active branches in probability theory. In practice, also, we are often faced with random experiments whose outcomes are not numbers but are expressed in inexact linguistic terms.
