Goodrich,Catherine C. McGeoch,1999-01-01 Symmetric multiprocessors SMPs dominate the high end server market and are currently the primary candidate for constructing large scale multiprocessor systems Yet the design of e cient parallel algorithms for this platform c rently poses several challenges The reason for this is that the rapid progress in microprocessor speed has left main memory access as the primary limitation to SMP performance Since memory is the bottleneck simply increasing the n ber of processors will not necessarily yield better performance Indeed memory bus limitations typically limit the size of SMPs to 16 processors This has at least twoimplicationsfor the algorithmdesigner First since there are relatively few processors availableon an SMP any parallel algorithm must be competitive with its sequential counterpart with as little as one processor in order to be r evant Second for the parallel algorithm to scale with the number of processors it must be designed with careful attention to minimizing the number and type of main memory accesses In this paper we present a computational model for designing e cient al rithms for symmetric multiprocessors We then use this model to create e cient solutions to two widely di erent types of problems linked list pre x com tations and generalized sorting Both problems are memory intensive but in die rent ways Whereas generalized sorting algorithms typically require a large numberofmemoryaccesses they areusuallytocontiguousmemorylocations By contrast prex computation algorithms typically require a more modest qu tity of memory accesses but they are are usually to non contiguous memory locations
