*Building a Columnar Database on RAMCloud* Christian Tinnefeld,2015-07-07 This book examines the field of parallel database management systems and illustrates the great variety of solutions based on a shared storage or a shared nothing architecture Constantly dropping memory prices and the desire to operate with low latency responses on large sets of data paved the way for main memory based parallel database management systems However this area is currently dominated by the shared nothing approach in order to preserve the in memory performance advantage by processing data locally on each server The main argument this book makes is that such an unilateral development will cease due to the combination of the following three trends a Today s network technology features remote direct memory access RDMA and narrows the performance gap between accessing main memory on a server and of a remote server to and even below a single order of magnitude b Modern storage systems scale gracefully are elastic and provide high availability c A modern storage system

such as Stanford's RAM Cloud even keeps all data resident in the main memory. Exploiting these characteristics in the context of a main memory based parallel database management system is desirable. The book demonstrates that the advent of RDMA enabled network technology makes the creation of a parallel main memory DBMS based on a shared storage approach feasible.

collaboration and electronic commerce      *IBM Spectrum Virtualize HyperSwap SAN Implementation and Design Best Practices* David Green, Jordan Fincher, IBM Redbooks, 2020-04-23 In this paper we outline some IBM Spectrum Virtualize HyperSwap SAN implementation and design best practices for optimum resiliency of the SAN Volume Controller cluster It provides IBM Spectrum Virtualize HyperSwap and Stretched Cluster configuration details Note In this book for brevity we use HyperSwap to refer to both HyperSwap and Stretched Cluster The documentation there details the minimum requirements However it does not describe the design of the storage area network SAN in detail nor does it describe the recommended way to implement those requirements on a SAN In this IBM Redpaper publication we outline some of the best practices for SAN design and implementation that leads to optimum resiliency of the SAN Volume Controller SVC cluster and we explain why each recommendation is made This paper is SAN vendor neutral wherever possible Any mention of a specific SAN switch vendor or terms used by a specific switch vendor is made only where relevant to a specific context and does not imply an endorsement of a specific switch vendor Note Some of the figures in this document might not depict redundant fabrics or storage configurations This was done for simplicity and it should be assumed that any recommendations made for fabric design assume that there are two redundant fabrics
