web the cooling curve a plot of temperature versus cooling time in figure pageindex 4 plots temperature versus time as a  $75 \text{ g}$  sample of steam initially at  $1 \text{ atm}$  and  $200^\circ\text{C}$  is cooled although we might expect the cooling curve to be the mirror image of the heating curve in figure pageindex 3 the cooling curve is not an

web once all of the material has solidified at the time indicated by point c the cooling will continue at a rate determined by the heat capacities of the two solids a and b the composition and of course the geometry of the experimental set up by measuring cooling curves for samples of varying composition one can map the entire phase

web heating and cooling curves are graphs they plot a substance's temperature y axis against heat x axis for heating curves

we start with a solid and add heat energy for cooling curves we start with the gas phase and remove heat energy cooling and heating curves have five segments let s study each one by looking at heating ice to

web for water this temperature is 100 c because the boiling point for water is 100 c different substances have different melting points and boiling points but the shapes of their heating curves are very similar for example this is the heating curve for iron a metal that melts at 1538 c and boils at 2861 c cooling curves
