MCSE (Exam 70-088) Proxy Server 2.0

Study Guide & Test Preparation

TRANSLATING ADDRESSES

LOCAL ADDRESS TABLE (LAT) – Created during installation. Defines internal IP address ranges so that local clients requesting an object from an internal server can obtain the object directly from the internal server and bypass the proxy server. Excluding external addresses causes internal client requests to external servers to be filtered. If internal addresses are included in the LAT, access to internal resources will be granted to external addresses. Internal requests for those addresses would also bypass the proxy server. Once the LAT is created, it is stored in a file called MSPLAT.TXT in the default location C:\MSP\CLERVS. Proxy Server clients download the file from the shared directory to keep the client configuration current.

CHOOSING SERVICES

Services can be configured through property sheets. Below each security, caching, and logging option that can be found in the tabs of the property sheet. There are three services:

WEB PROXY SERVICE

- Compliance with CERN Proxy protocol
- HTTP and FTP caching
- Reverse proxying and reverse hosting in conjunction with Web publishing
- User-level–defined permissions for protocols
- Restricted access to the Internet
- IP address aggregation
- Logged information

WINSOCK PROXY SERVICE

- Uses either TCP/IP or IPX/SPX on the internal network
- Windows NT Challenge/Response authentication
- Compatible with most Windows Sockets 1.1–compatible programs
- Controlled outbound and inbound access
- Restricted access to the Internet
- Restricted access to the Internet
- IP address aggregation
- Logged information
- Client compatibility

NEWS PROXY SERVICE

- Secure communication between client and server
- Uses the TCP/IP protocol on the internal network
- Supports the Network News Transfer Protocol
- Compatible with popular operating systems
- Logs information about hosts requested

CONNECTIVITY METHODS

A connectivity method is the protocol the client and server use to communicate across the network. There are two choices:

IPX/SPX – Used primarily in Novell NetWare networks

Advantages – Speed, dynamic addressing existing NetWare network security

Disadvantages – Protocol overhead; only supports Windows 95, Windows 98, and NT

TCP/IP – Widely used by almost all platforms

Advantages – Routing, net command execution, supports all clients, scalability, well-known for the Internet method

Disadvantages – Address administration, security

FAULT TOLERANCE STRATEGY

FAULT TOLERANCE – The ability to provide uninterrupted access to the Internet in a network if the proxy server goes down. Used for clients who connect to networks with more than one connection to the Internet.

CHAIN ARRAYS – A group of proxy servers acting as a single logical cache that results in multiple proxy servers cooperating with each other to avoid interrupted service. Fault tolerance is provided when each proxy server in an array keeps a list of servers that are available or down. A request to a proxy server uses a mathematical procedure called a hash to find the correct route to a cached object. Calculations take place at the proxy server level or at the browser level. The browser must be version 4 or higher (Explorer).

ARRAY ROUTING – A proxy server that does providing fault tolerance to upstream paths. Affects portions of your network or the Internet. There is only one connection to the external network to a single array. Configuring routing provides a backup network path to the Internet and/or the central office of a branch. Supported only by clients Proxy service. Routing can be configured to route client requests to a proxy server upstream or directly to the Internet. A route to the Internet can be a connection such as an ISDN line or a modem line.

TYPES OF AUTHENTICATION

There are three types of authentication available with Internet Information Server (IIS). Configure the authentication method that will use to the WWW service properties pages in Internet Service Manager. Authentication is set through the Service tab in the WWW service properties sheet.

ALLOW ANONYMOUS LOGON – A default user account is created named IUSR_computername at the time of IIS installation. In the Password Authentication section of the WWW service properties pages, choose Allow Anonymous. Resources can be accessed by anonymous users for which the IUSR_computername account has permissions. No Access rights are assigned with NTFS permissions for the IUSR_computername account for the restricted directory or file.

BASIC AUTHENTICATION (CLEAR TEXT) – Sent across the wire in clear text with user credentials encoded. It offers weak security and should only be used when necessary. A necessary example is a Unix-based Web browser. Basic authentication can be applied to all users or a subset of users.

WINDOWS NT CHALLENGE/RESPONSE AUTHENTICATION – Does not transmit user passwords across the network. It performs calculations on the server and the client. There is no prompt for a name or password because the client software was established logon information. It is more secure than Basic but only works if the client browser is Microsoft Internet Explorer; the client and server are on the same or a trusted domain; and it must be on a Windows platform.

LOAD BALANCING

LOAD BALANCING – Process of distributing the workload equally among multiple servers. There are three methods:

Domain Name System (DNS) – Individual IP addresses for each proxy server are mapped to the same domain name. Name through a list of IP addresses mapped to the domain name in the DNS server provides lookup requests. Not fault tolerant.

Array – Each proxy server maintains a list of servers that are currently up or down. Provides load balancing and fault tolerance. Automatically synchronizes configurations of all array members. You will need to create a domain name in DNS. Map the domain name to the IP addresses of proxy servers in the array. The loss of an individual proxy server will cause the array to reconfigure.

Cache Array Routing Protocol (CARP) – Used in arrays to achieve load balancing and fault tolerance with caching. Achieved using multiple proxy servers arrayed as a single logical cache. Calculations based on the proxy array membership and the Uniform Resource Locator (URL) determine the request resolution path. A process called querying distributed caching will occur: the cache object is retrieved by the proxy server's browser that has the object in cache or the first array members of the correct proxy server accessed by the browser. Reduces network traffic and lowers disk space needed for caching.

MINIMUM HARDWARE REQUIREMENTS

- Intel x86 (80486 or faster, or Alpha AXP)
- At least 16MB of disk space for installation of Proxy Server. There must also be an NTFS partition of at least 1MB.
- At least 24MB of RAM; 32MB for RISC-based systems

You may want to double or triple for optimum configuration, especially RAM.

CONFIGURATION TOOLS

Although Internet Service Manager is your primary tool for configuring and administering Proxy Server, there are several other tools that you can use.

REGEDT32/REGEDIT32 – Available by default on Windows NT Server. They can be used to inspect or export registry files. They can also be used to create, edit, add, delete, rename, and create new keys and values.

REMOTMSP – A command line utility used to perform administration and configuration tasks. Can be used in batch scripts and to control multiple servers. At a command prompt, switch to the directory where Proxy Server is installed and type `remotmsp -h` to display command syntax.

MPSADMIN – Used to add, delete, or edit Winsock Proxy service protocol definitions. At a command prompt, switch to the proxy server directory. Type `MspProtocol` for syntax.

NET START – Command used to start and stop WWW services, Web Proxy service, and Socks Proxy service.

SERVICES CONTROL PANEL – Used to enable or disable services. Controls whether a service starts manually or automatically.
