Nonlinear Control Systems Design 1989 A. Isidori,2014-05-23 In the last two decades the development of specific methodologies for the control of systems described by nonlinear mathematical models has attracted an ever increasing interest New breakthroughs have occurred which have aided the design of nonlinear control systems However there are still limitations which must be understood some of which were addressed at the IFAC Symposium in Capri The emphasis was on the methodological developments although a number of the papers were concerned with the presentation of applications of nonlinear design philosophies to actual control problems in chemical electrical and mechanical engineering

Variable Structure Control Systems David Wayne Ginsberg,1989 Power Systems and Power Plant Control 1989 U. Ahn,2014-06-05 The control of power systems and power plants is a subject of growing interest which continues to sustain a high level of research development and application in many diverse yet complementary areas such as maintaining a high quality but economical service and coping with environmental constraints The papers included within this volume provide the most up to date developments in this field of research

Adaptive Systems in Control and Signal Processing 1989 T.S. Durrani,D.H. Owens,M.A. Johnson,M.J. Grimble,2014-06-28 The Symposium covered three major areas adaptive control identification and signal processing In all three new developments were discussed covering both theoretical and applications research Within the subject area of adaptive control the discussion centred around the challenges of robust control design to unmodelled dynamics robust parameter estimation and enhanced performance from the estimator while the papers on identification took the theme of it being a bridge between adaptive control and signal processing The final area looked at two aspects of signal processing recursive estimation and adaptive filters

Automatic Control Systems with Variable Structure S. V. Emelyanov,FOREIGN TECHNOLOGY DIV WRIGHT-PATTERSON AFB OHIO.,1970 The book examines principles of construction of one class of nonlinear automatic control systems systems with variable structure Basic attention is allotted to different problems of control of linear objects with constant and variable parameters both for free and for forced motions It is shown that the principle of changeability of structure permits ensuring high quality control of free motion of an

object and in the case of change of parameters in a wide range permits constructing a system insensitive to these changes Methods of synthesis of control for objects working under conditions of continuously acting external perturbing forces are given It is shown that for a broad class of disturbances it is possible to ensure independence of quality indicators of the control process by using executing devices with variable structure A very important peculiarity of the examined class of systems from the practical point of view is that for realization of offered laws of control required is information neither about the value of variable parameters of the object nor on disturbances applied to it The offered methods of control of objects with one adjustable value are generalized in case of multiconnected objects with several adjustable coordinates Author

Variable Structure Control of Complex Systems Xing-Gang Yan, Sarah K. Spurgeon, Christopher Edwards, 2016-12-05 This book systematizes recent research work on variable structure control It is self contained presenting necessary mathematical preliminaries so that the theoretical developments can be easily understood by a broad readership The text begins with an introduction to the fundamental ideas of variable structure control pertinent to their application in complex nonlinear systems In the core of the book the authors lay out an approach suitable for a large class of systems that deals with system uncertainties with nonlinear bounds Its treatment of complex systems in which limited measurement information is available makes the results developed convenient to implement Various case study applications are described from aerospace through power systems to river pollution control with supporting simulations to aid the transition from mathematical theory to engineering practicalities The book addresses systems with nonlinearities time delays and interconnections and considers issues such as stabilization observer design and fault detection and isolation It makes extensive use of numerical and practical examples to render its ideas more readily absorbed *Variable Structure Control of Complex Systems* will be of interest to academic researchers studying control theory and its application in nonlinear time delayed an modular large scale systems the robustness of its approach will also be attractive to control engineers working in industries associate with aerospace electrical and mechanical engineering
