Cancer Modeling:

Multiscale Cancer Modeling Thomas S. Deisboeck, Georgios Stamatakos, 2010-12-08 Cancer is a complex disease process that spans multiple scales in space and time Driven by cutting edge mathematical and computational techniques in silico biology provides powerful tools to investigate the mechanistic relationships of genes cells and tissues It enables the creation of experimentally testable hypotheses the integration of data

Selected Topics in Cancer Modeling Nicola Bellomo, Elena de Angelis, 2008-09-25 This collection of selected chapters offers a comprehensive overview of state of the art mathematical methods and tools for modeling and analyzing cancer phenomena Topics covered include stochastic evolutionary models of cancer initiation and progression tumor cords and their response to anticancer agents and immune competition in tumor progression and prevention The complexity of modeling living matter requires the development of new mathematical methods and ideas This volume written by first rate researchers in the field of mathematical biology is one of the first steps in that direction

Tumor Models in Cancer Research Beverly A. Teicher, 2010-12-01 The past 6 years since the first edition of this book have seen great progress in the development of genetically engineered mouse GEM models of cancer These models are finding an important role in furthering our understanding of the biology of malignant disease A comfortable position for GEM models in the routine conduct of screening for potential new therapeutics is coming more slowly but is coming Increasing numbers of genetically engineered mice are available some with conditional activation of oncogenes some with multiple genetic changes providing mouse models that are moving closer to the human disease

Multiscale Modeling of Cancer Vittorio Cristini, John Lowengrub, 2010-09-09 Mathematical modeling analysis and simulation are set to play crucial roles in explaining tumor behavior and the uncontrolled growth of cancer cells over multiple time and spatial scales This book the first to integrate state of the art numerical techniques with experimental data provides an in depth assessment of tumor cell modeling at multiple scales The first part of the text presents a detailed biological background with an examination of single phase and multi phase continuum tumor modeling discrete cell modeling and hybrid continuum discrete modeling In the final two chapters the authors guide the reader through problem based illustrations and case studies of brain and breast cancer to demonstrate the future potential of modeling in cancer research This book has wide interdisciplinary appeal and is a valuable resource for mathematical biologists biomedical engineers and clinical cancer research communities wishing to understand this emerging field

Handbook of Cancer Models with Applications W. Y. Tan, 2008 Composed of contributions from an international team of leading researchers this book pulls together the most recent research results in the field of cancer modeling to provide readers with the most advanced mathematical models of cancer and their applications Topics included in the book cover oncogenetic trees stochastic multistage models of carcinogenesis effects of ionizing radiation on cell cycle and genomic instability induction of DNA damage by ionizing radiation and its repair epigenetic cancer models bystander effects of radiation multiple pathway models of human colon

cancer and stochastic models of metastasis The book also provides some important applications of cancer models to the assessment of cancer risk associated with various hazardous environmental agents to cancer screening by MRI and to drug resistance in cancer chemotherapy An updated statistical design and analysis of xenograft experiments as well as a statistical analysis of cancer occult clinical data are also provided The book will serve as a useful source of reference for researchers in biomathematics biostatistics and bioinformatics for clinical investigators and medical doctors employing quantitative methods to develop procedures for cancer diagnosis prevention control and treatment and for graduate students

Animal Modeling in Cancer Vladimir Korinek,2021-08-27 Dear Readers Understanding the pathological mechanisms involved in human diseases and their possible treatment has been historically based on comparative analysis of diverse animal species that share a similar genetic physiological and behavioural composition The ancient Greeks were the first to use animals as models for anatomy and physiology and this was consequently adopted by other cultures and led to important discoveries In recent years there have been many efforts to understand and fight cancer through new revolutionary personalized treatments and wider screenings that help diagnose and treat cancer A fundamental part of this effort is to develop suitable cancer animal models that simulate the different disease variants and their progression Ranging from tumor derived xenografts to genetically engineered models a wide variety of systems are applied for this purpose and many technological breakthroughs are changing the way cancer is studied and analyzed In this Special Issue we collected a set of research articles and reviews that focus on the generation of cancer animal models that are used for understanding the disease and contribute to designing and testing new drugs for cancer prevention or treatment Vladimir Korinek Collection Editor

An Introduction to Physical Oncology Vittorio Cristini,Eugene Koay,Zhihui Wang,2017-06-26 Physical oncology has the potential to revolutionize cancer research and treatment The fundamental rationale behind this approach is that physical processes such as transport mechanisms for drug molecules within tissue and forces exchanged by cancer cells with tissue may play an equally important role as biological processes in influencing progression and treatment outcome This book introduces the emerging field of physical oncology to a general audience with a focus on recent breakthroughs that help in the design and discovery of more effective cancer treatments It describes how novel mathematical models of physical transport processes incorporate patient tissue and imaging data routinely produced in the clinic to predict the efficacy of many cancer treatment approaches including chemotherapy and radiation therapy By helping to identify which therapies would be most beneficial for an individual patient and quantifying their effects prior to actual implementation in the clinic physical oncology allows doctors to design treatment regimens customized to each patient's clinical needs significantly altering the current clinical approach to cancer treatment and improving the outcomes for

patients

Biophysics and Cancer Claudio A. Nicolini, 1986 Since the early times of the Greek philosophers Leucippus and Democritus and later of the Roman philosopher Lucretius a simple fundamental idea emerged that brought the life sciences into the realm of the physical sciences Atoms after various interactions were assumed to acquire stable configurations that corresponded either to the living or to the inanimate world This simple and unitary theory which has evolved in successive steps to our present time remarkably maintained its validity despite several centuries of alternative vicissitudes and is the foundation of modern biophysics Some of the recent developments of this ancient idea are the discovery of the direct relationship between spatial structures and chemical activity of such molecules as methane and benzene and the later discovery of the three dimensional structure of double helical DNA and of its relationship with biological activity The relationship between the structure of various macromolecules and the function of living cells was one of the most striking advancements of modern science obtained by the cooperation of physicists chemists mathematicians engineers biologists and physicians This crossing of the life and physical sciences has given rise to new and exciting frontiers and to a new synthesis where there is a frequent interconnection of expertise and where there is an exchange of roles among traditionally separated soft and hard sciences Even if knowledge is still transmitted to new generations within universities as separate disciplines new knowledge is acquired today in the laboratory by truly interdisciplinary teams

Mathematical Models of Cancer and Different Therapies Regina Padmanabhan, Nader Meskin, Ala-Eddin Al Moustafa, 2020-10-31 This book provides a unified framework for various currently available mathematical models that are used to analyze progression and regression in cancer development and to predict its dynamics with respect to therapeutic interventions Accurate and reliable model representations of cancer dynamics are milestones in the field of cancer research Mathematical modeling approaches are becoming increasingly common in cancer research as these quantitative approaches can help to validate hypotheses concerning cancer dynamics and thus elucidate the complexly interlaced mechanisms involved Even though the related conceptual and technical information is growing at an exponential rate the application of said information and realization of useful healthcare devices are lagging behind In order to remedy this discrepancy more interdisciplinary research works and course curricula need to be introduced in academic industrial and clinical organizations alike To that end this book reformulates most of the existing mathematical models as special cases of a general model allowing readers to easily get an overall idea of cancer dynamics and its modeling Moreover the book will help bridge the gap between biologists and engineers as it brings together cancer dynamics the main steps involved in mathematical modeling and control strategies developed for cancer management This also allows readers in both medical and engineering fields to compare and contrast all the therapy based models developed to date using a single source and to identify unexplored research directions
