**Building Academic Language** Jeff Zwiers, 2013-02-20 Many students ranging from native English speakers to recent immigrants need help in understanding and using the language of school. Language is the lifeblood of learning in all content areas and it plays a major role in academic achievement. *Building Academic Language* explains the functions and features of academic language that every teacher—language arts, history, math, science, etc.—should know for supporting academic reading, writing, and discussion. The book includes research-based instructional and assessment activities that content teachers can use to build students' abilities to understand and describe the many abstract concepts, higher-order thinking skills, and complex relationships in a discipline. The book emphasizes an approach that builds from students' existing ways of learning and communicating, scaffolding them to think and talk as content area experts think and talk about math, science, history, and language arts. Major topics and themes include: What is academic language and how does it differ by content area? How can language building activities, discussions, small groups, etc. support content understanding? How can we build language abilities for content reading and writing, and vice versa? How can we build on students' diverse ways of understanding learning and communicating about the world? How can we more effectively model and scaffold academic language in our teaching and assessment?

**Building Experiments** David Willer, Henry A. Walker, 2007 Ranging from abstract theory to practical design solutions, this book provides the reader with the understandings needed to design and run cutting-edge experiments.

*Building Intelligent Interactive Tutors* Beverly Park Woolf, 2010-07-28 *Building Intelligent Interactive Tutors* discusses educational systems that assess a student's knowledge and are adaptive to a student's learning needs. The impact of computers has not been generally felt in education due to lack of hardware, teacher training, and sophisticated software, and because current instructional software is neither truly responsive to student needs nor flexible enough to emulate teaching. Dr. Woolf taps into 20 years of research on intelligent tutors to bring designers and developers a broad range of issues and methods that produce the best intelligent learning environments possible, whether for classroom or life-long learning. The book describes multidisciplinary approaches to using computers for teaching, reports on research, development, and real-world experiences, and discusses intelligent tutors, web-based learning systems, adaptive learning systems, intelligent agents, and intelligent multimedia. It is recommended for professionals, graduate students, and others in computer science and educational technology who are developing online tutoring systems to support e-learning and who want to build intelligence into the system. Combines both theory and practice to offer most in depth and up-to-date treatment of intelligent tutoring systems available. Presents powerful drivers of virtual teaching systems including cognitive science, artificial intelligence, and the Internet. Features algorithmic material that enables programmers and researchers to design building components and intelligent systems.
