**Tools for Testing Computer System Vulnerability** W. Timothy Polk, 1992 Computer security incidents occur with alarming frequency The incidents range from direct attacks by both hackers and insiders to automated attacks such as network worms Weak system controls are frequently cited as the cause but many of these incidents are the result of improper use of existing control mechanisms For example improper access control specifications for key system files could open the entire system to unauthorized access Moreover many computer systems are delivered with default settings that if left unchanged leave the system exposed This document discusses automated tools for testing computer system vulnerability By analyzing factors affecting the security of a computer system a system manager can identify common vulnerabilities stemming from administrative errors Using automated tools this process may examine the content and protections of hundreds of files on a multi user system and identify subtle vulnerabilities By acting on this information system

administrators can significantly reduce their systems security exposure **Automated Tools for Testing Computer**
