

$$e_a \frac{\partial^2 u}{\partial t^2} + d_a \frac{\partial u}{\partial t} - \nabla \cdot (c \nabla u + \alpha u - \gamma) + \beta \cdot \nabla u + a u = f$$

The diagram illustrates the physical interpretation of the terms in the equation:

- $e_a$ : mass
- $d_a$ : damping/mass
- $c$ : diffusion
- $\alpha$ : source
- $a$ : absorption
- $\beta$ : convection
- $\gamma$ : conservative flux

- Nuclear Science Abstracts** ,1966      **Semigroup Approach To Nonlinear Diffusion Equations** Viorel Barbu,2021-09-23 This book is concerned with functional methods nonlinear semigroups of contractions nonlinear m accretive operators and variational techniques in the theory of nonlinear partial differential equations of elliptic and parabolic type In particular applications to the existence theory of nonlinear parabolic equations nonlinear Fokker Planck equations phase transition and free boundary problems are presented in details Emphasis is put on functional methods in partial differential equations PDE and less on specific results      *The Physics of Semiconductors* Kevin F. Brennan,1999-02-13 Modern fabrication techniques have made it possible to produce semiconductor devices whose dimensions are so small that quantum mechanical effects dominate their behavior This book describes the key elements of quantum mechanics statistical mechanics and solid state physics that are necessary in understanding these modern semiconductor devices The author begins with a review of elementary quantum mechanics and then describes more advanced topics such as multiple quantum wells He then disusses equilibrium and nonequilibrium statistical mechanics Following this introduction he provides a thorough treatment of solid state physics covering electron motion in periodic potentials electron phonon interaction and recombination processes The final four chapters deal exclusively with real devices such as semiconductor lasers photodiodes flat panel displays and MOSFETs The book contains many homework exercises and is suitable as a textbook for electrical engineering materials science or physics students taking courses in solid state device physics It will also be a valuable reference for practising engineers in optoelectronics and related areas      **The Mathematics of Diffusion** John Crank,1979 Though it incorporates much new material this new edition preserves the general character of the book in providing a collection of solutions of the equations of diffusion and describing how these solutions may be obtained      **Nonlinear Diffusion Equations** Zhuoqun Wu,2001 Nonlinear diffusion equations an important class of parabolic equations come from a variety of diffusion phenomena which appear widely in nature They are suggested as mathematical models of physical problems in many fields such as filtration phase transition biochemistry and dynamics of biological groups In many cases the equations possess degeneracy or singularity The appearance of degeneracy or singularity makes the study more involved and challenging Many new ideas and methods have been developed to overcome the special difficulties caused by the degeneracy and singularity which enrich the theory of partial differential equations This book provides a comprehensive presentation of the basic problems main results and typical methods for nonlinear diffusion equations with degeneracy Some results for equations with singularity are touched upon      *Defects and Diffusion in Ceramics IX* David Fisher,2007-11-20 An Annual Retrospective IX      [The Mathematics of Diffusion](#) Wei-Ming Ni,2011-10-13 Diffusion has been used extensively in many scientific disciplines to model a wide variety of phenomena The Mathematics of Diffusion focuses on the qualitative properties of solutions to nonlinear elliptic and parabolic equations and

systems in connection with domain geometry various boundary conditions the mechanism of different diffusion rates and the interaction between diffusion and spatial heterogeneity The book systematically explores the interplay between different diffusion rates from the viewpoint of pattern formation particularly Turing's diffusion driven instability in both homogeneous and heterogeneous environments and the roles of random diffusion directed movements and spatial heterogeneity in the classical Lotka Volterra competition systems Interspersed throughout the book are many simple fundamental and important open problems for readers to investigate

**Nonlinear Diffusion Equations and Their Equilibrium States, 3** N.G Lloyd, M.G. Ni, L.A. Peletier, J. Serrin, 2012-12-06 Nonlinear diffusion equations have held a prominent place in the theory of partial differential equations both for the challenging and deep mathematical questions posed by such equations and the important role they play in many areas of science and technology Examples of current interest are biological and chemical pattern formation semiconductor design environmental problems such as solute transport in groundwater flow phase transitions and combustion theory Central to the theory is the equation  $U_t + \text{div}(c \nabla U) = f(U)$  Here  $\text{div}$  denotes the  $n$ -dimensional Laplacian  $c$  and  $f$  are given functions and the solution is defined on some domain  $\Omega \times [0, T]$  in space-time Fundamental questions concern the existence uniqueness and regularity of solutions the existence of interfaces or free boundaries the question as to whether or not the solution can be continued for all time the asymptotic behavior both in time and space and the development of singularities for instance when the solution ceases to exist after finite time either through extinction or through blow-up
